Background

- **Since 2000 – 9 Mcy of sand have been placed on South Beach.**
- **The Village elected to pursue construction of a terminal groin.**

WHAT IS A TERMINAL GROIN?

(HINT: It's not a jetty)

- Meant to stabilize the end of a littoral cell, not specifically improve an inlet.
- Structure must be “leaky” (i.e. low and permeable).
- Large uniform armor rock.
- Serve as a template for updrift shoreline.

COASTAL ARMORING IN THE TAR HEEL STATE

- **2011: SB 110 repealed decades-long ban on hard structures allowing for potential construction of up to four “test” terminal groins.**
- **2013-15: Bald Head Groin was permitted and constructed.**
- **Complex analysis required for permitting and construction.**

Modeling Difficulties

Nobody's perfect!

Relevant Delft3D Limitations

While powerful, Delft3D could not:

- account for repose of a slope due to “avalanching”.
 - Could not model immediate response to dredging.

 - Could not model immediate response to dredging.
- precisely describe the permeability of a structure.
 - Requires sensitivity testing

Relevant Delft3D Limitations

While powerful, Delft3D could not:

- account for repose of a slope due to “avalanching”.
 - Could not model immediate response to dredging.
- precisely describe the permeability of a structure.
 - Requires sensitivity testing
- predict MHW shoreline position.
 - Can predict submerged shorelines (MLLW).
- fully describe inlet shoreline physics (ship wake, wind waves, etc.)

So, how was Delft3D applied?

Evaluate E.I.S. alternative actions

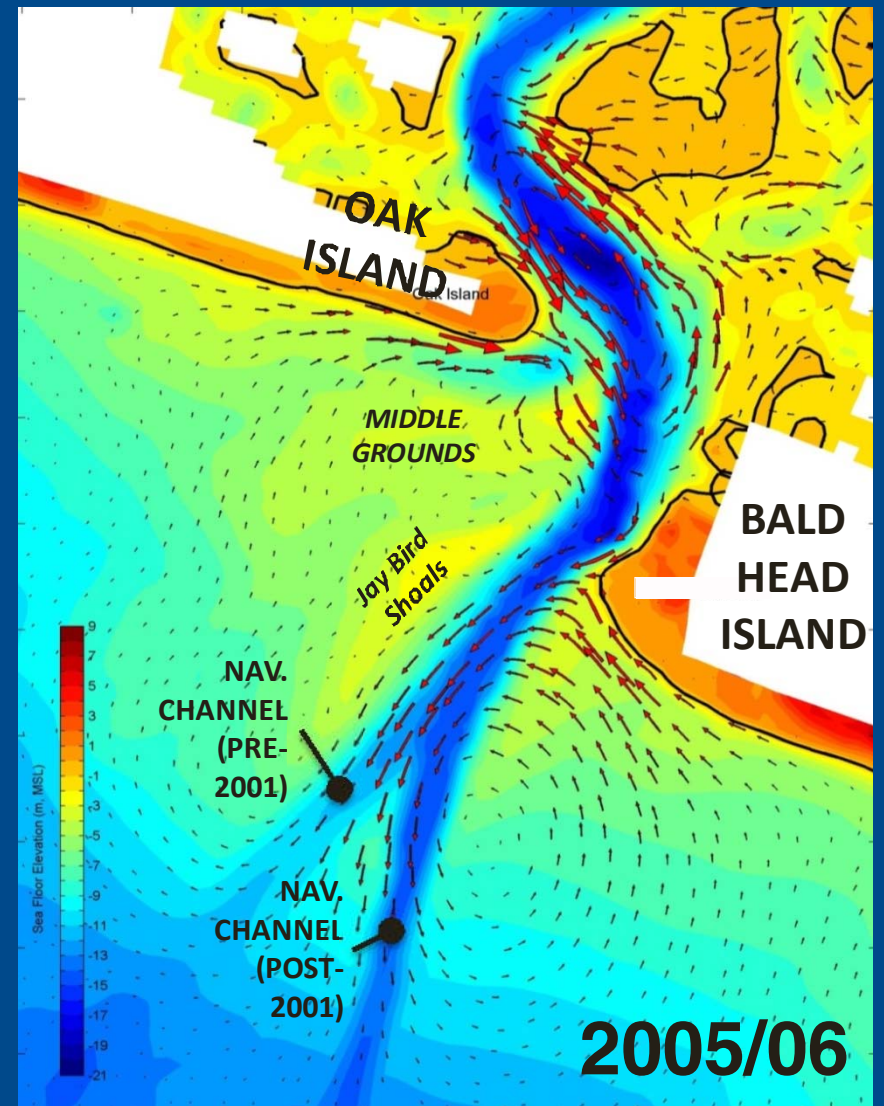

- Performance predictions

Also modeled:

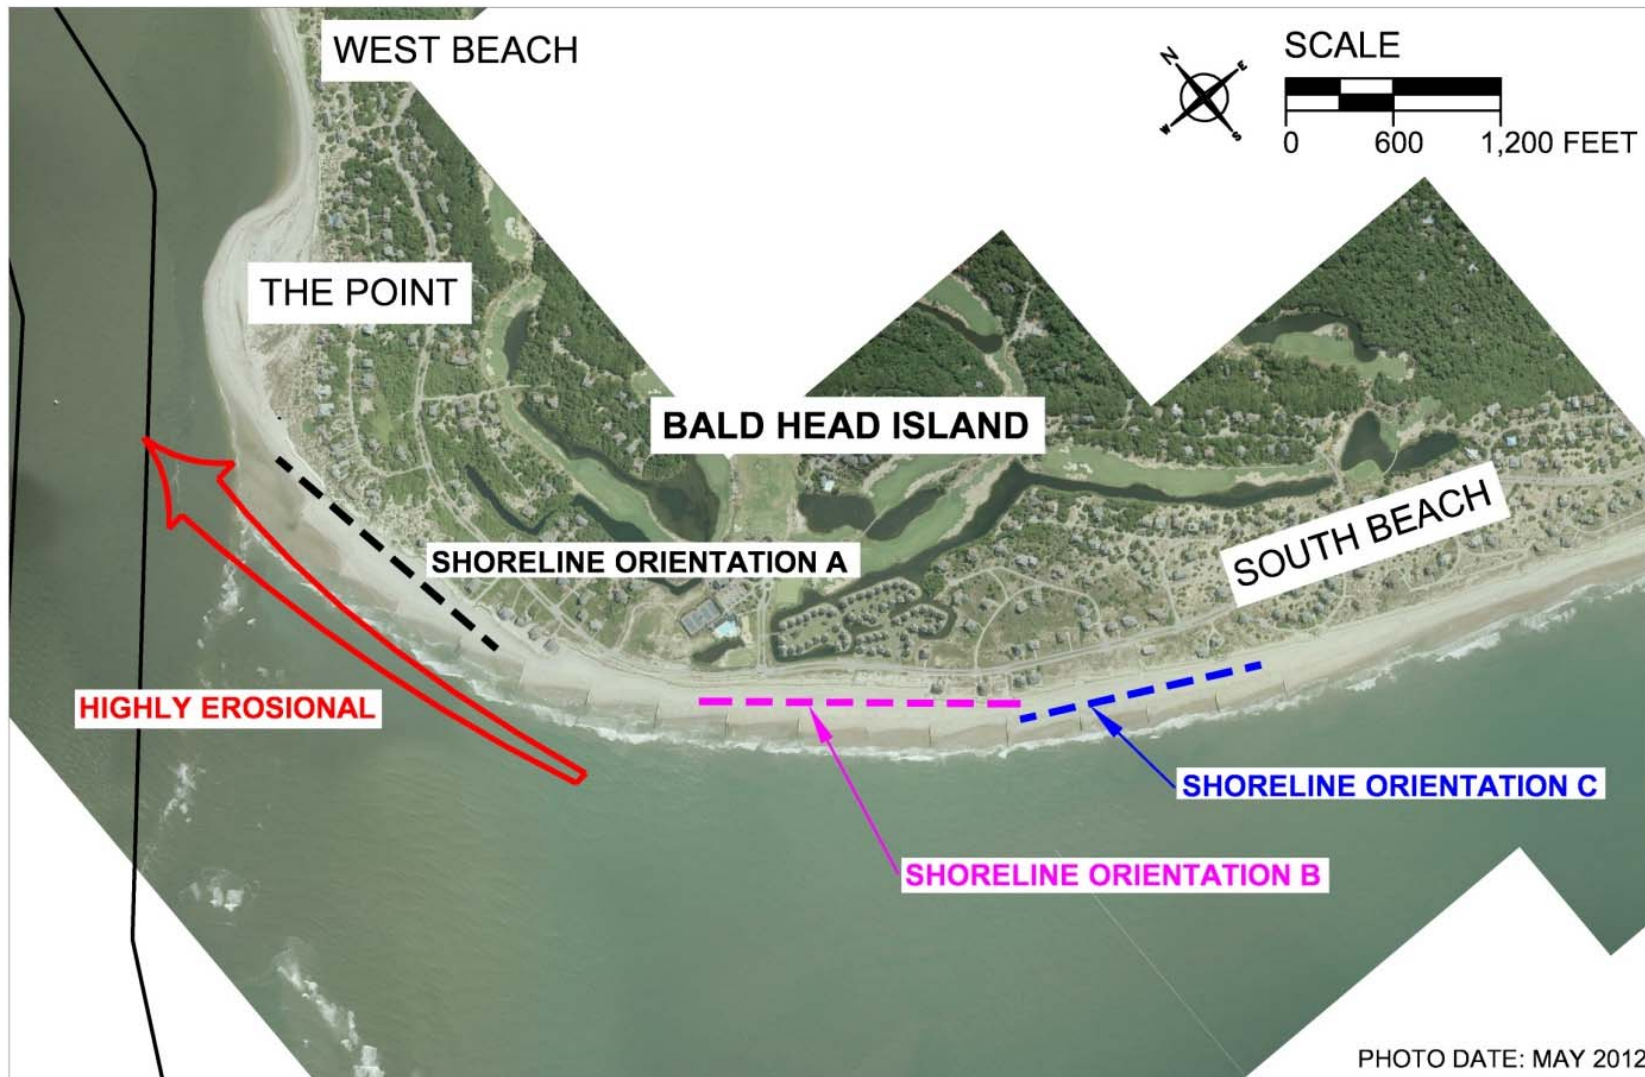

- Multiple channel orientations
- Multiple dredge scenarios
- Multiple shoreline alignments
- Tube groin field alterations
- Sediment Budget
- Historical inlet configurations

Groin Length

- Modeling suggested a 1,900 ft groin would meet project goals.
- Engineering judgement elected to construct in two Phases.
