

TAYLOR ENGINEERING, INC.

Sea Level Rise Resilience & Living Shorelines

Overview

- Terminology
- Shoreline Stabilization Options
- Living Shoreline Designs
- Natural Resilience
- Room for Growth

Living Shoreline Defined

- Shoreline protection
- Allows natural coastal processes
- Strategic placement of :
 - Plants
 - Stone
 - Fill
 - Other structural organic materials:
 - Biologs
 - Oyster reefs

Living Shoreline Defined

- Absorbs wave energy
- Reduces erosion
- Filters water, traps pollutants and sediment
- Provides habitat for plants, fish, and wildlife
- Creates aesthetic and recreational value
- Resilient to changing environments, including SLR

Living Shoreline Defined

LIVING SHORELINES SUPPORT RESILIENT COMMUNITIES

Living shorelines use plants or other natural elements—sometimes in combination with harder shoreline structures—to stabilize estuarine coasts, bays, and tributaries.

One square mile of salt marsh stores the carbon equivalent of **76,000 gal of gas** annually.

Marshes trap sediments from tidal waters, allowing them to **grow in elevation** as sea level rises.

Living shorelines improve **water quality**, provide fisheries **habitat**, increase **biodiversity**, and promote **recreation**.

Marshes and oyster reefs act as natural **barriers** to waves. **15 ft** of marsh can **absorb 50%** of incoming wave energy.

Living shorelines are **more resilient** against storms than bulkheads.

33% of shorelines in the U.S. will be **hardened** by **2100**, decreasing fisheries habitat and biodiversity.

Hard shoreline structures like **bulkheads** prevent natural marsh migration and may create seaward **erosion**.

Resilience Defined

- Ability to bounce back quickly from adversity
- Recover without changing into something different

Shoreline Stabilization Options

HOW GREEN OR GRAY SHOULD YOUR SHORELINE SOLUTION BE?

GREEN - SOFTER TECHNIQUES

GRAY - HARDER TECHNIQUES

Living Shorelines

VEGETATION ONLY -
Provides a buffer to upland areas and breaks small waves. Suitable for low wave energy environments.

EDGING -
Added structure holds the toe of existing or vegetated slope in place. Suitable for most areas except high wave energy environments.

SILLS -
Parallel to vegetated shoreline, reduces wave energy, and prevents erosion. Suitable for most areas except high wave energy environments.

BREAKWATER -
(vegetation optional) - Offshore structures intended to break waves, reducing the force of wave action, and encourage sediment accretion. Suitable for most areas.

REVETMENT -
Lays over the slope of the shoreline and protects it from erosion and waves. Suitable for sites with existing hardened shoreline structures.

BULKHEAD -
Vertical wall parallel to the shoreline intended to hold soil in place. Suitable for high energy settings and sites with existing hard shoreline structures.

Natural Resilience of Living Shorelines

- Can keep up with current sea level rise trend
 - Wetlands can increase upward 12 mm/yr
 - Mangroves can migrate landward faster than SLR
 - Oyster reefs can grow vertically up to 60 mm/yr
 - Beaches with nourishment can keep pace with SLR

Room for Growth

- Quantifiable metrics of success
 - Reduction of wave energy
 - Decreased erosion
 - Improved water quality
- Field data for calibrating models
- Costs of constructing and maintaining
