# County-Wide Baseline Coastal Analysis and Coastal Resilience Planning for Sarasota County

February 3, 2022

Wendy Laurent, P.E.

Angela Schedel, Ph.D., P.E.

Jenna Phillips

# Work Plan and Funding

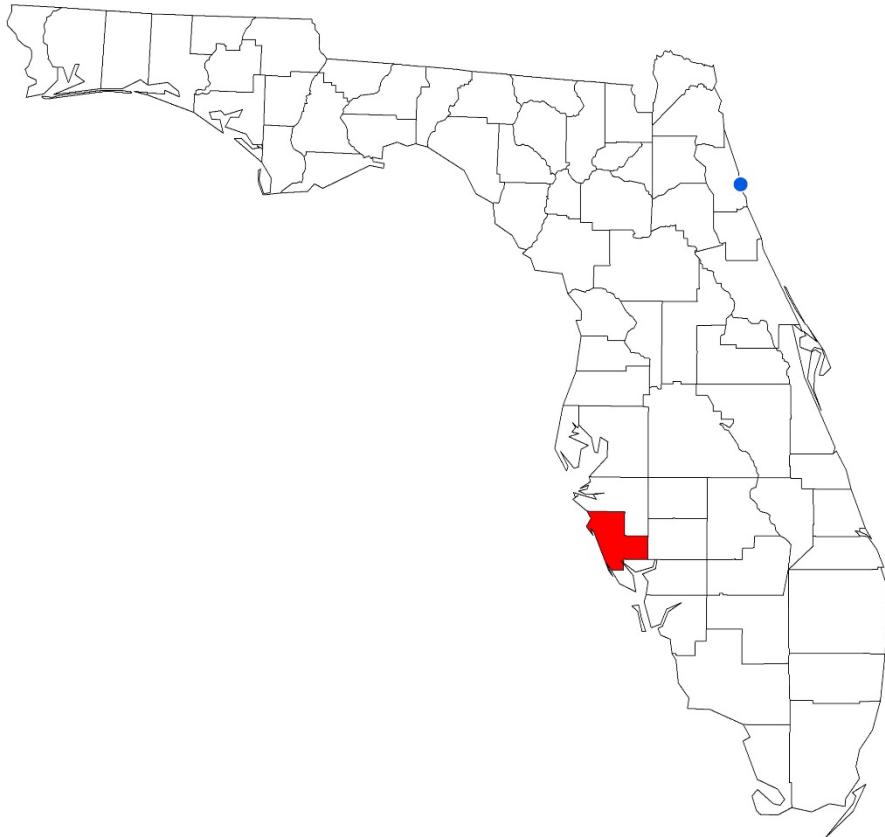

---

- Study funded by FL Resilient Coastlines Program (FRCP)
  - Grant for Resilience Planning
- Work plan tasks:
  1. Research Current Shoreline Management Approaches
  2. Conduct a Baseline Coastal Conditions Assessment
  3. Evaluate Coastal Infrastructure for Vulnerability to SLR
  4. Executive Summary of Results
  5. Public Outreach

# Study Area– Sarasota County

- 37 mi of Gulf facing shoreline
  - 25 mi critically eroded (68%)
  - 14 mi actively managed (38%)
- Overview of Sarasota County Beaches
  - Focus on beaches that are not “actively managed”
  - Examine the erosion history and current beach width
  - Although the primary focus of the study was on beaches that have not been nourished, this study provided an overview of the county’s beach nourishment projects
    - Understand the impacts the projects have on adjacent shorelines and their historic performance

# Beach Reaches

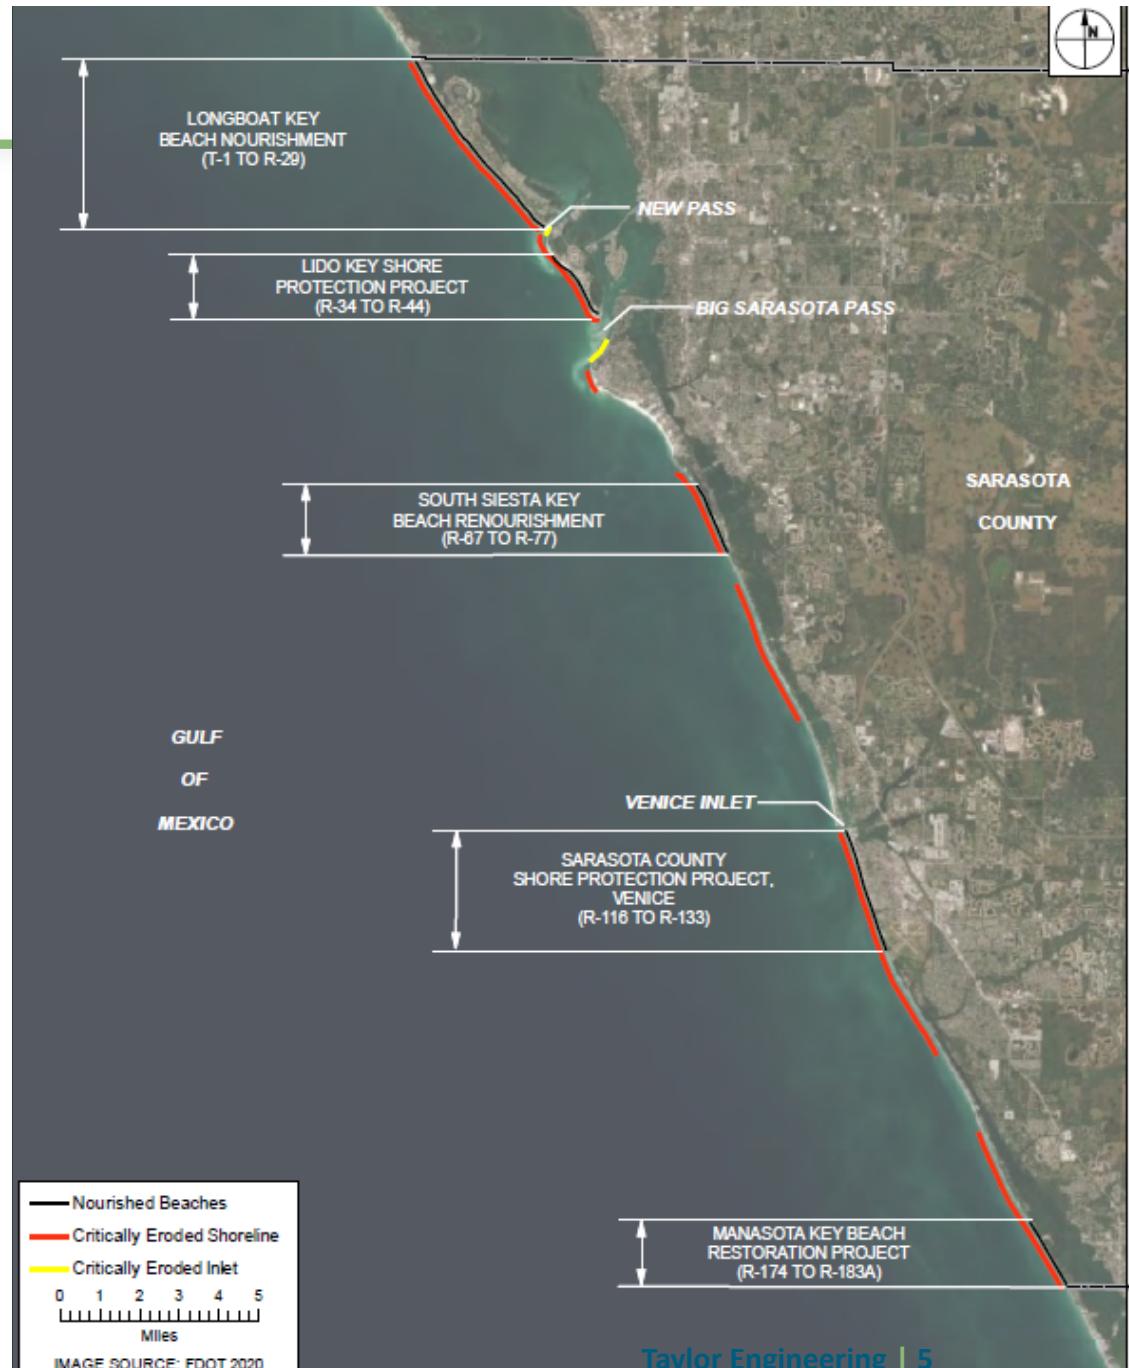

- Step 1: establish beach reaches
  - 18 beach reaches
  - 6 reaches are “actively managed”
- “Actively Managed Beach”
  - defined as a beach that has a sustained history of beach nourishment
- 16.8 million cubic yards placed in history of Sarasota County nourishment projects
  - Nourishment history and actively managed beach performance informs overall understanding of adjacent shoreline conditions

Beach Reach	R-monuments
<i>Longboat Key Beach Nourishment Project</i>	T-1 to R-29
Lido Key	R-30 to R-33
<i>Lido Key Shore Protection Project</i>	R-34 to R-44
Big Sarasota Pass South Bank	R-44A to R-44D
Siesta Key	R-45 to R-61A
Point O' Rocks	R-62 to R-66
<i>South Siesta Key Beach Renourishment Project</i>	R-67 to R-77
South Siesta Key	R-78
North Casey Key	R-79 to R-88
Casey Key	R-89 to R-114
Venice Inlet	R-115
<i>Sarasota County Shore Protection Project Venice Segment</i>	R-116 to R-133
South Venice	R-134 to R-135
Caspersen Beach	R-136 to T-145
Manasota Key	R-146 to R-173
<i>Manasota Key Beach Restoration Project Segment 1</i>	R-174 to R-177
Manasota Key South	R-178 to R-180
<i>Manasota Key Beach Restoration Project Segment 2</i>	R-181 to R-183A

\**Italics indicate a beach defined as actively managed per this study*

# Beach Reaches– Actively Managed

- Nourishment history and actively managed beach performance informs overall understanding of adjacent shoreline conditions
- 5 ongoing beach nourishment project
- 16.8 million cubic yards placed

# Beach Reaches– Actively Managed

- Longboat Key Beach Nourishment

- T-1 to R-29
- 20 nourishment events placing 7.5 million cubic yards, initial nourishment in 1993
- Sand sourced from New Pass, Longboat Pass, offshore, and upland

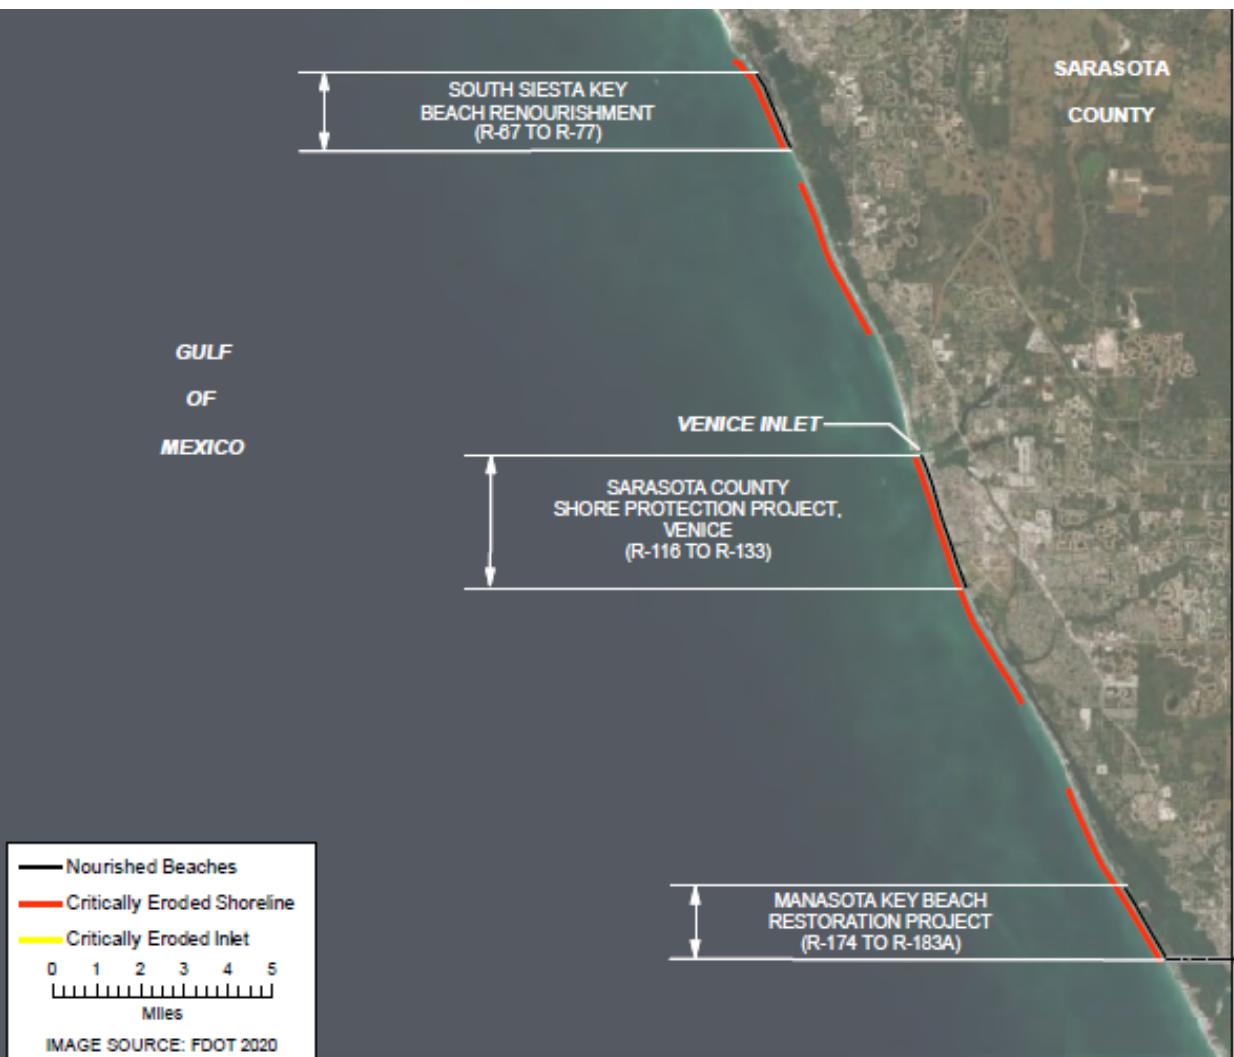

- Lido Key Shore Protection Project

- R-34 to R-44
- 15 nourishment events placing 4.2 million cubic yards, initial nourishment in 1964
- Sand sourced from New Pass, Big Pass, offshore, and upland

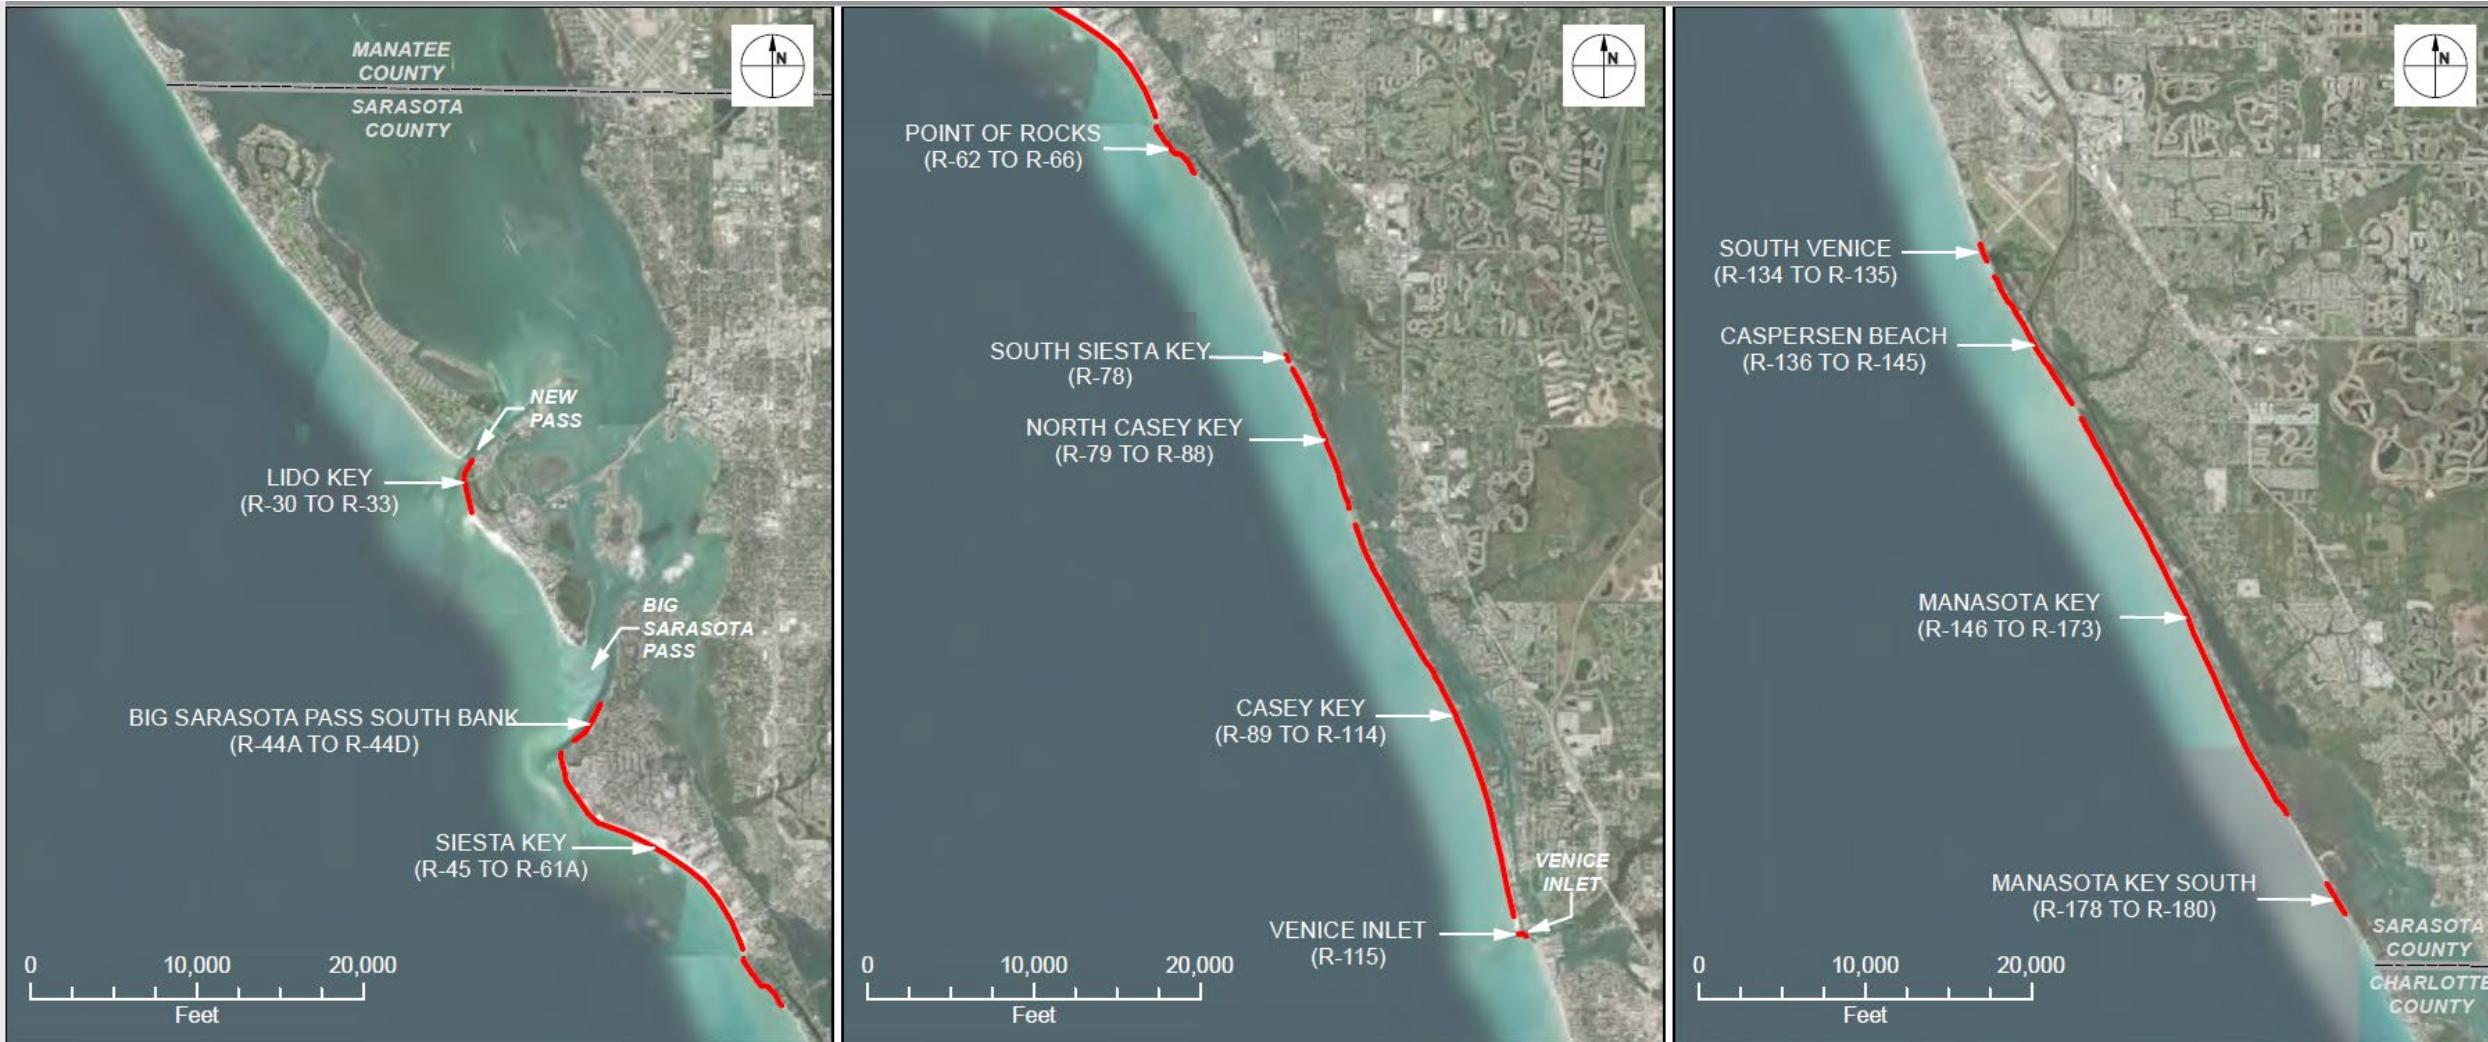

# Beach Reaches– Actively Managed

- **South Siesta Beach Nourishment Project**
  - R-67 to R-77
  - 2 nourishment events placing 1.6 million cubic yards, initial nourishment in 2007
  - Sand sourced from offshore
- **Sarasota County SPP – Venice Beach**
  - R-116 to R-133
  - 3 nourishment events placing 3.3 million cubic yards, initial nourishment in 1994
  - Sand sourced from offshore
- **Manasota Key Restoration Project**
  - R-174 to R-177; R181 to R-183A
  - 1 nourishment event, 0.3 million cubic yards, initial nourishment in 2020
  - Sand sourced from offshore

# Beach Reaches– Not “Actively Managed”

# Beach Condition Assessment

## Mean High Water Shoreline Position

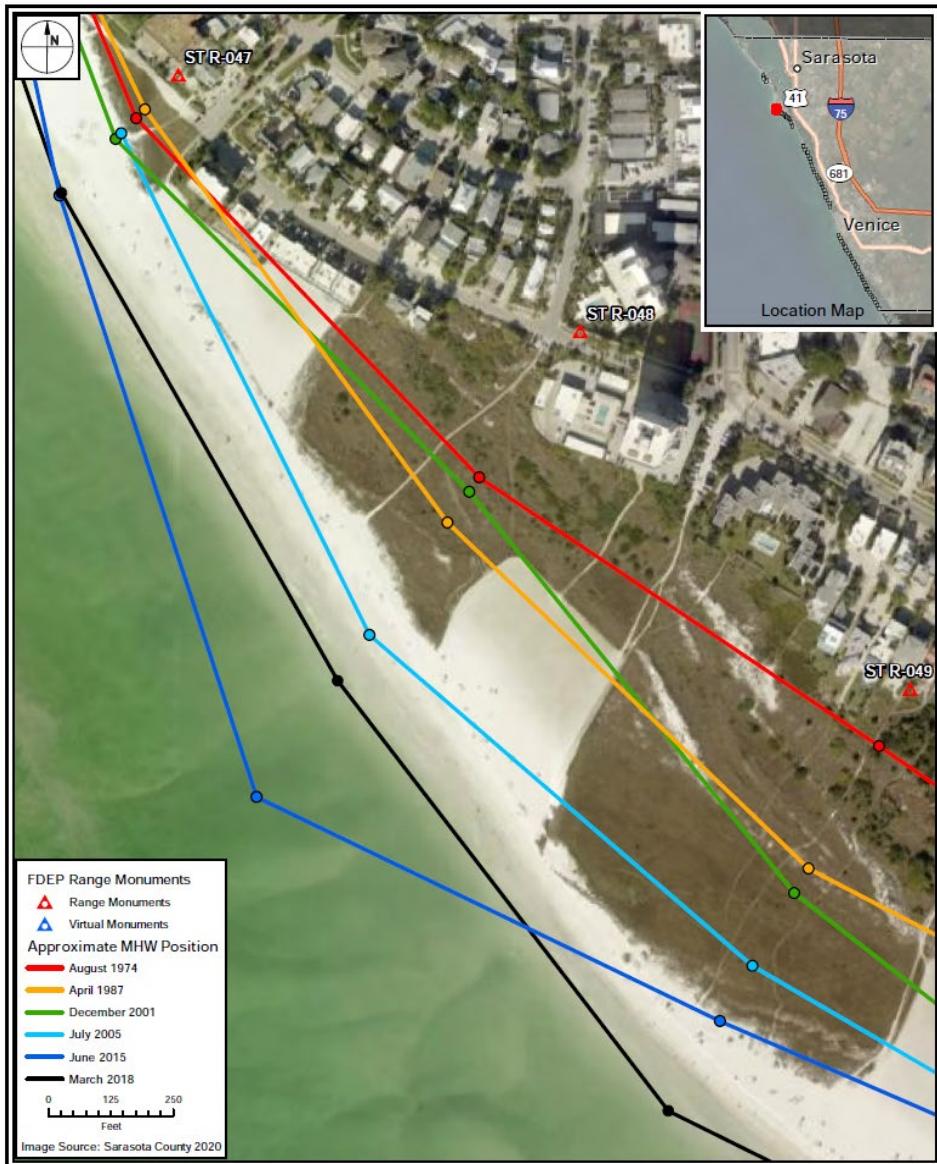

- MHW elevations vary throughout the County
  - +0.30 ft NAVD88 to +0.54 ft NAVD88
- 6 datasets available that provided >90% survey coverage along the County's not "actively managed" beaches (1974, 1987, 2001, 2005, 2015, 2018)

## Available Beach Width

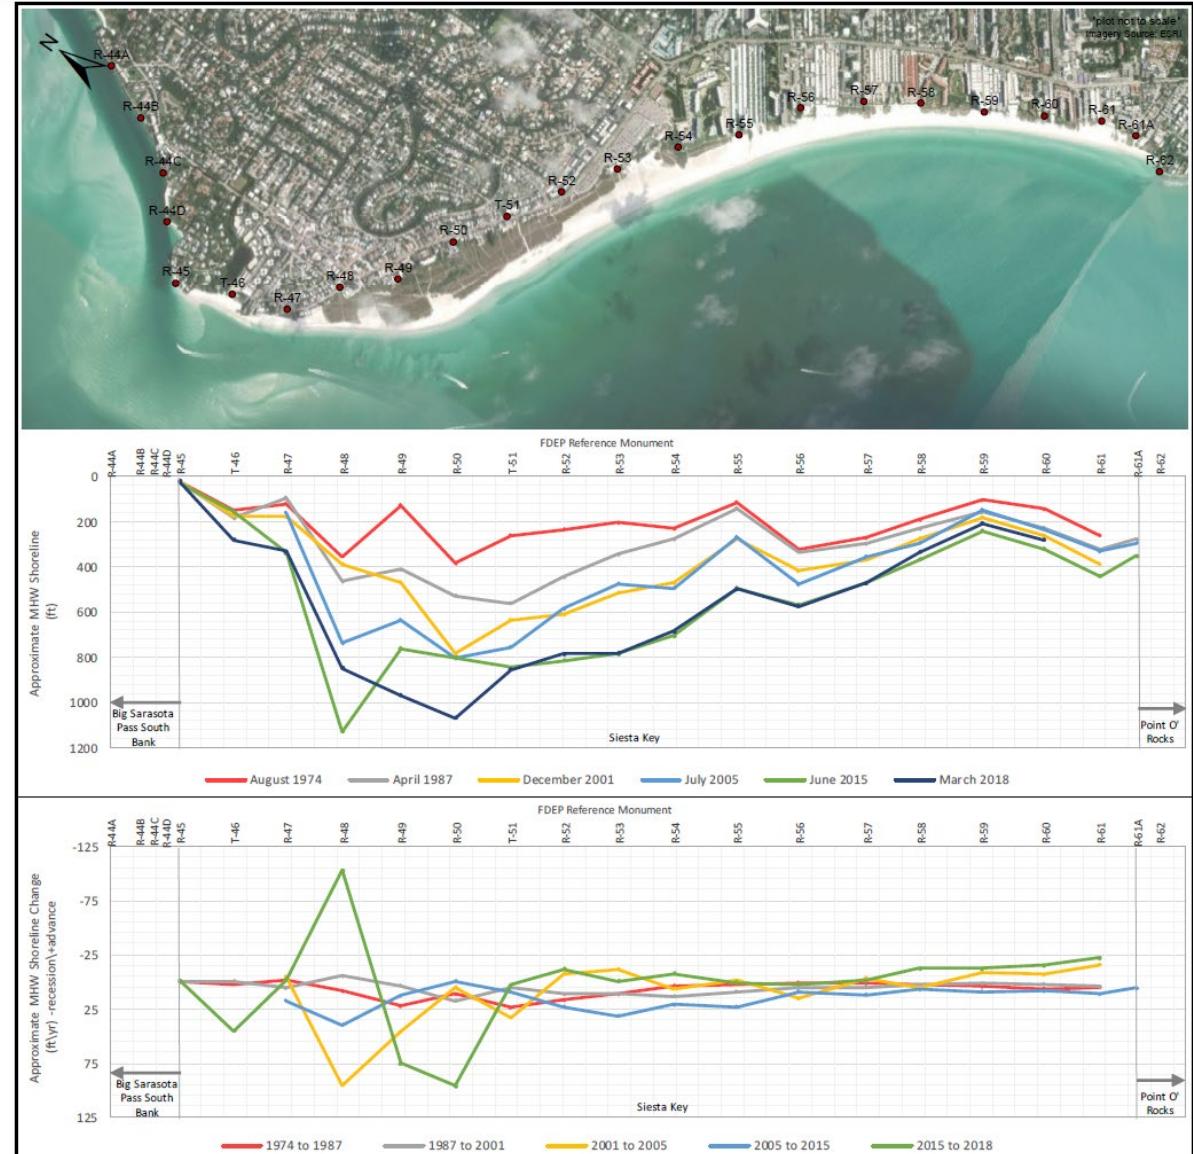

- Dry sandy beach berm that exists to buffer the effects of storms— "recreational beach"
- Available beach width defined as distance from derived baseline to the approximate MHW position
- Baseline delineated using the Sarasota County 2020 aerial imagery
  - edge of vegetation, shoreline armoring, dune feature, or infrastructure
- Focus on data from 2015, 2018, and 2020 due to significant shoreline recession observed in the MHW analysis

# Beach Condition Assessment Example– Siesta Key

Siesta Key

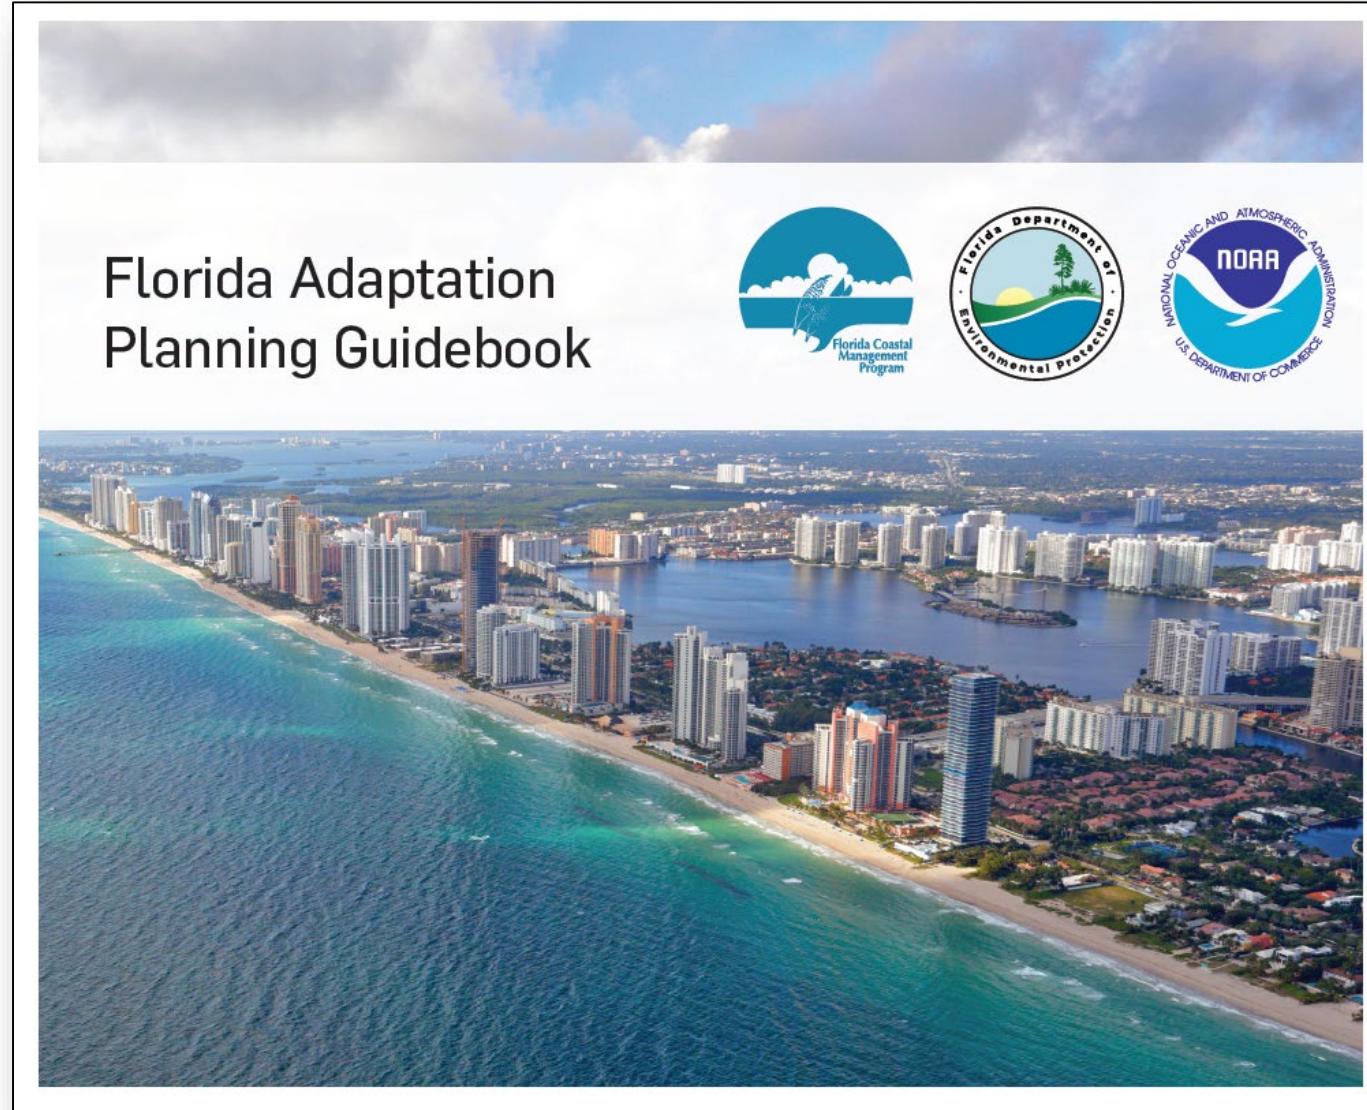

Taylor Engineering | 10

# Beach Condition Assessment– Summary and Conclusions

---

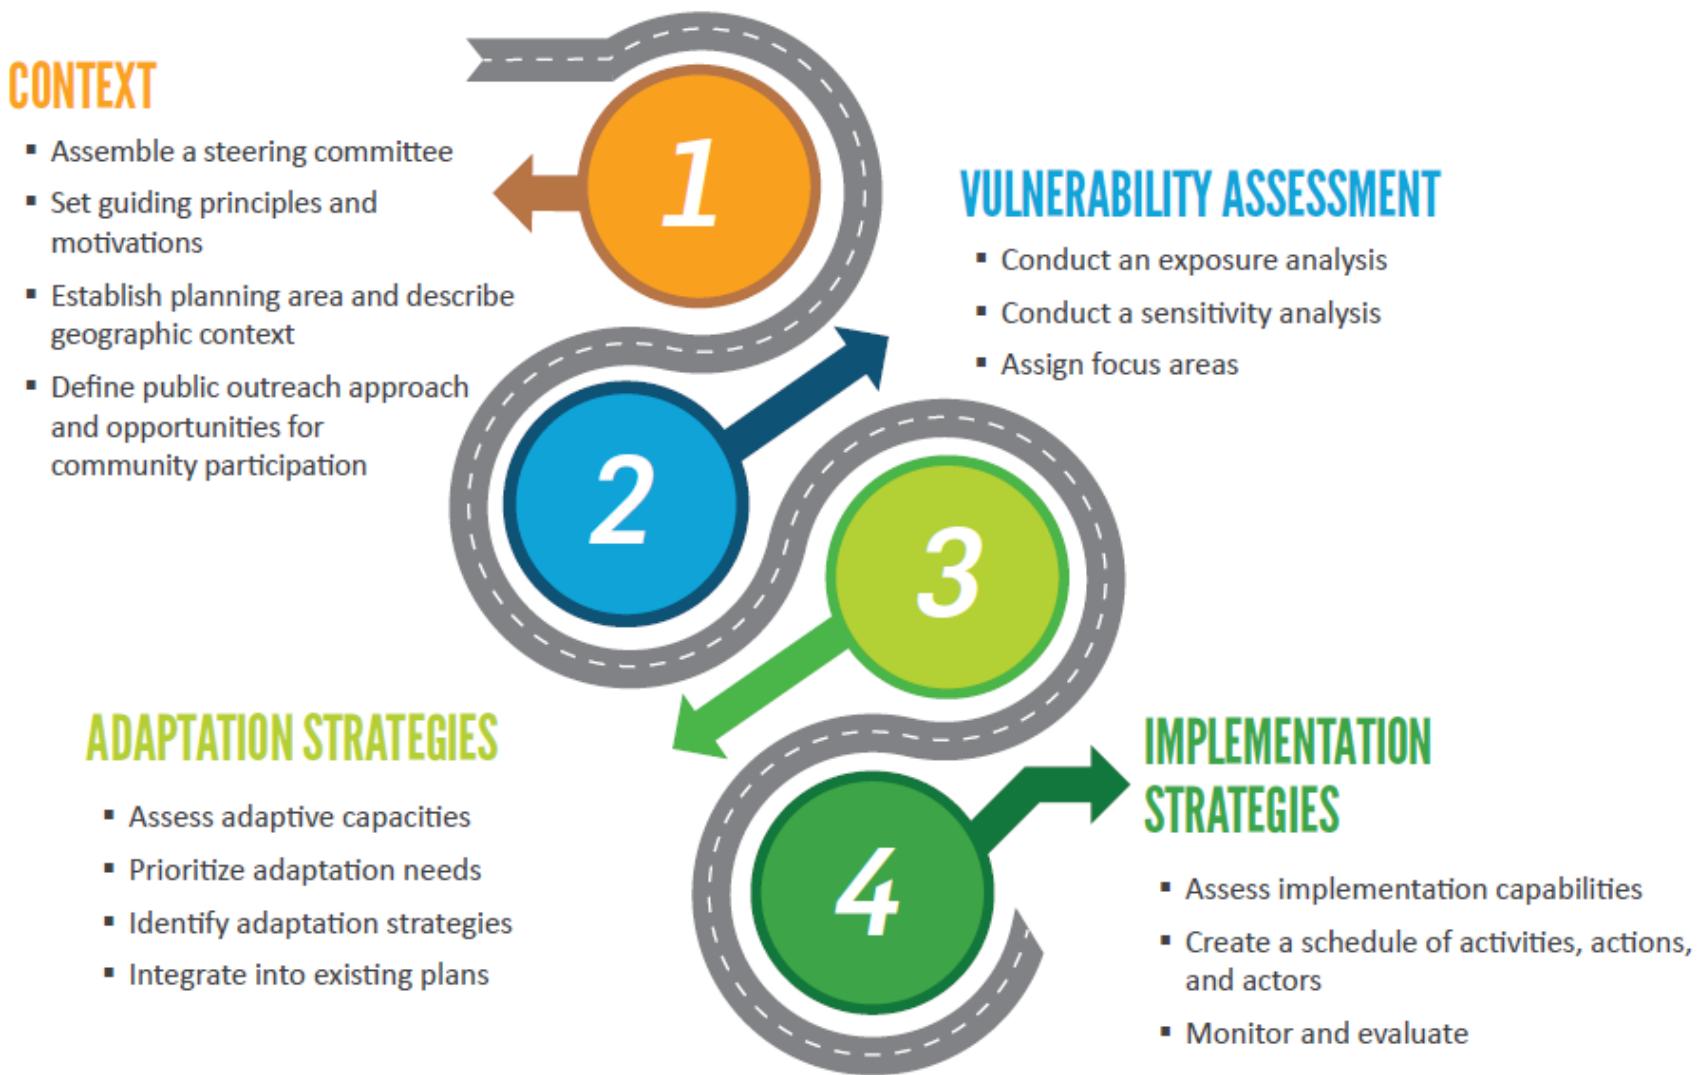

- Increased shoreline recession between 2015-2018
  - Continued into 2020 with the beach width analysis
  - Likely due to the cumulative effect of several storm systems in a short period of time
- Caspersen Beach experienced consistent shoreline retreat and is extremely narrow and deflated
- Monitor the evolution of fill from the nourished portion of Manasota Key to the adjacent shorelines
- Continue to monitor the influence of New Pass on the northern portion of Lido Key
- In comparison to the County's other beaches, Siesta Key provides storm protection benefits, however berm elevations are lower than other beach segments
- Suggest adopting regionally-focused, long-term beach monitoring plan to better monitor the impact of storms and dispersion of fill from actively managed beaches

# Adaptation Planning Process

*Source: Florida Adaptation Planning Guidebook*

# Sea Level Trend

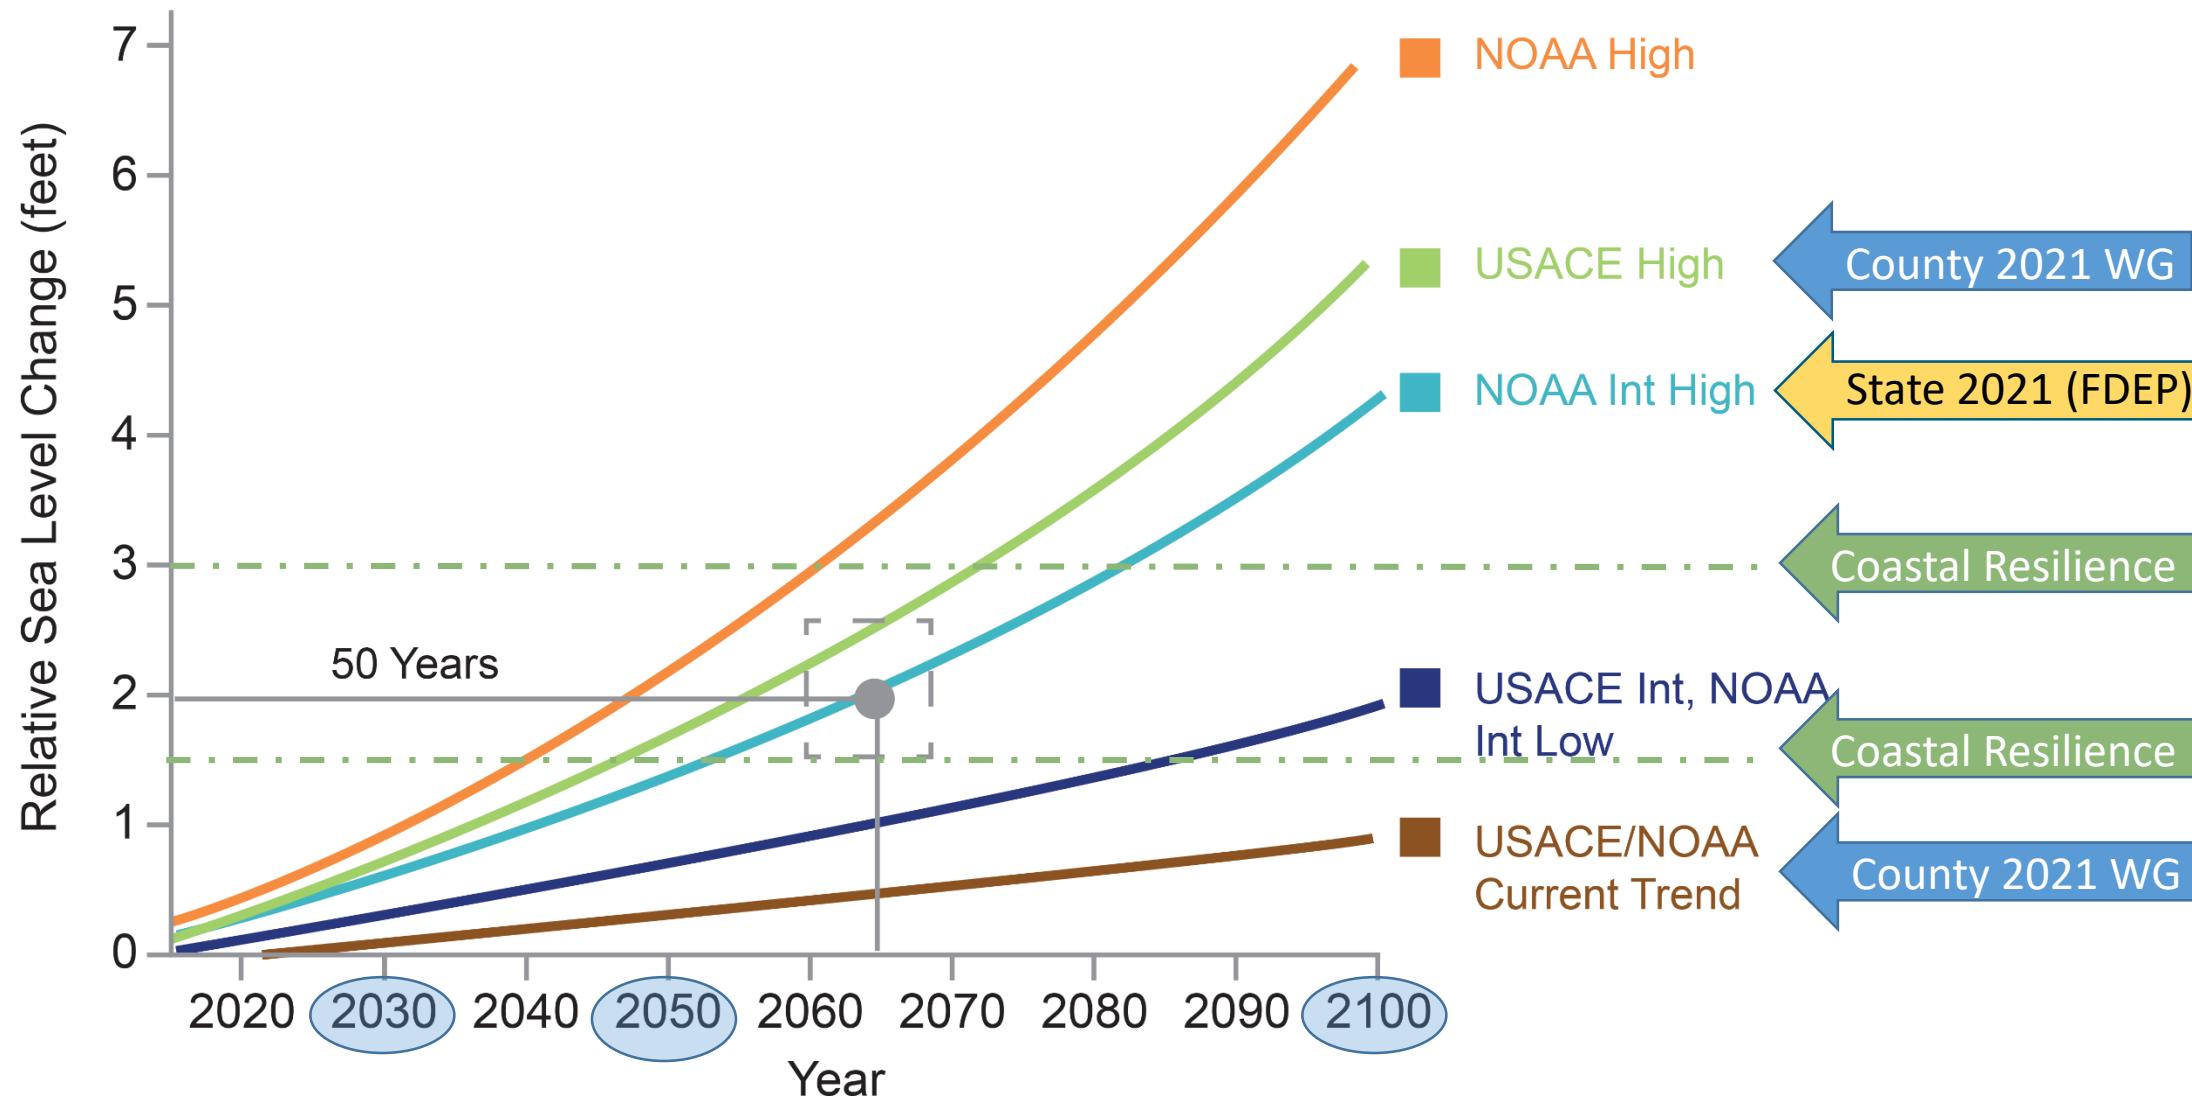

- Data at the St Petersburg NOAA Tide Gauge has been collected continuously since 1947
- This historic data shows a trend of about ~1 ft of rise over 100 yrs
- Global SLR is ~ 3mm per year, similar to this

# Sea Level Projections Used in Other Local Studies

---

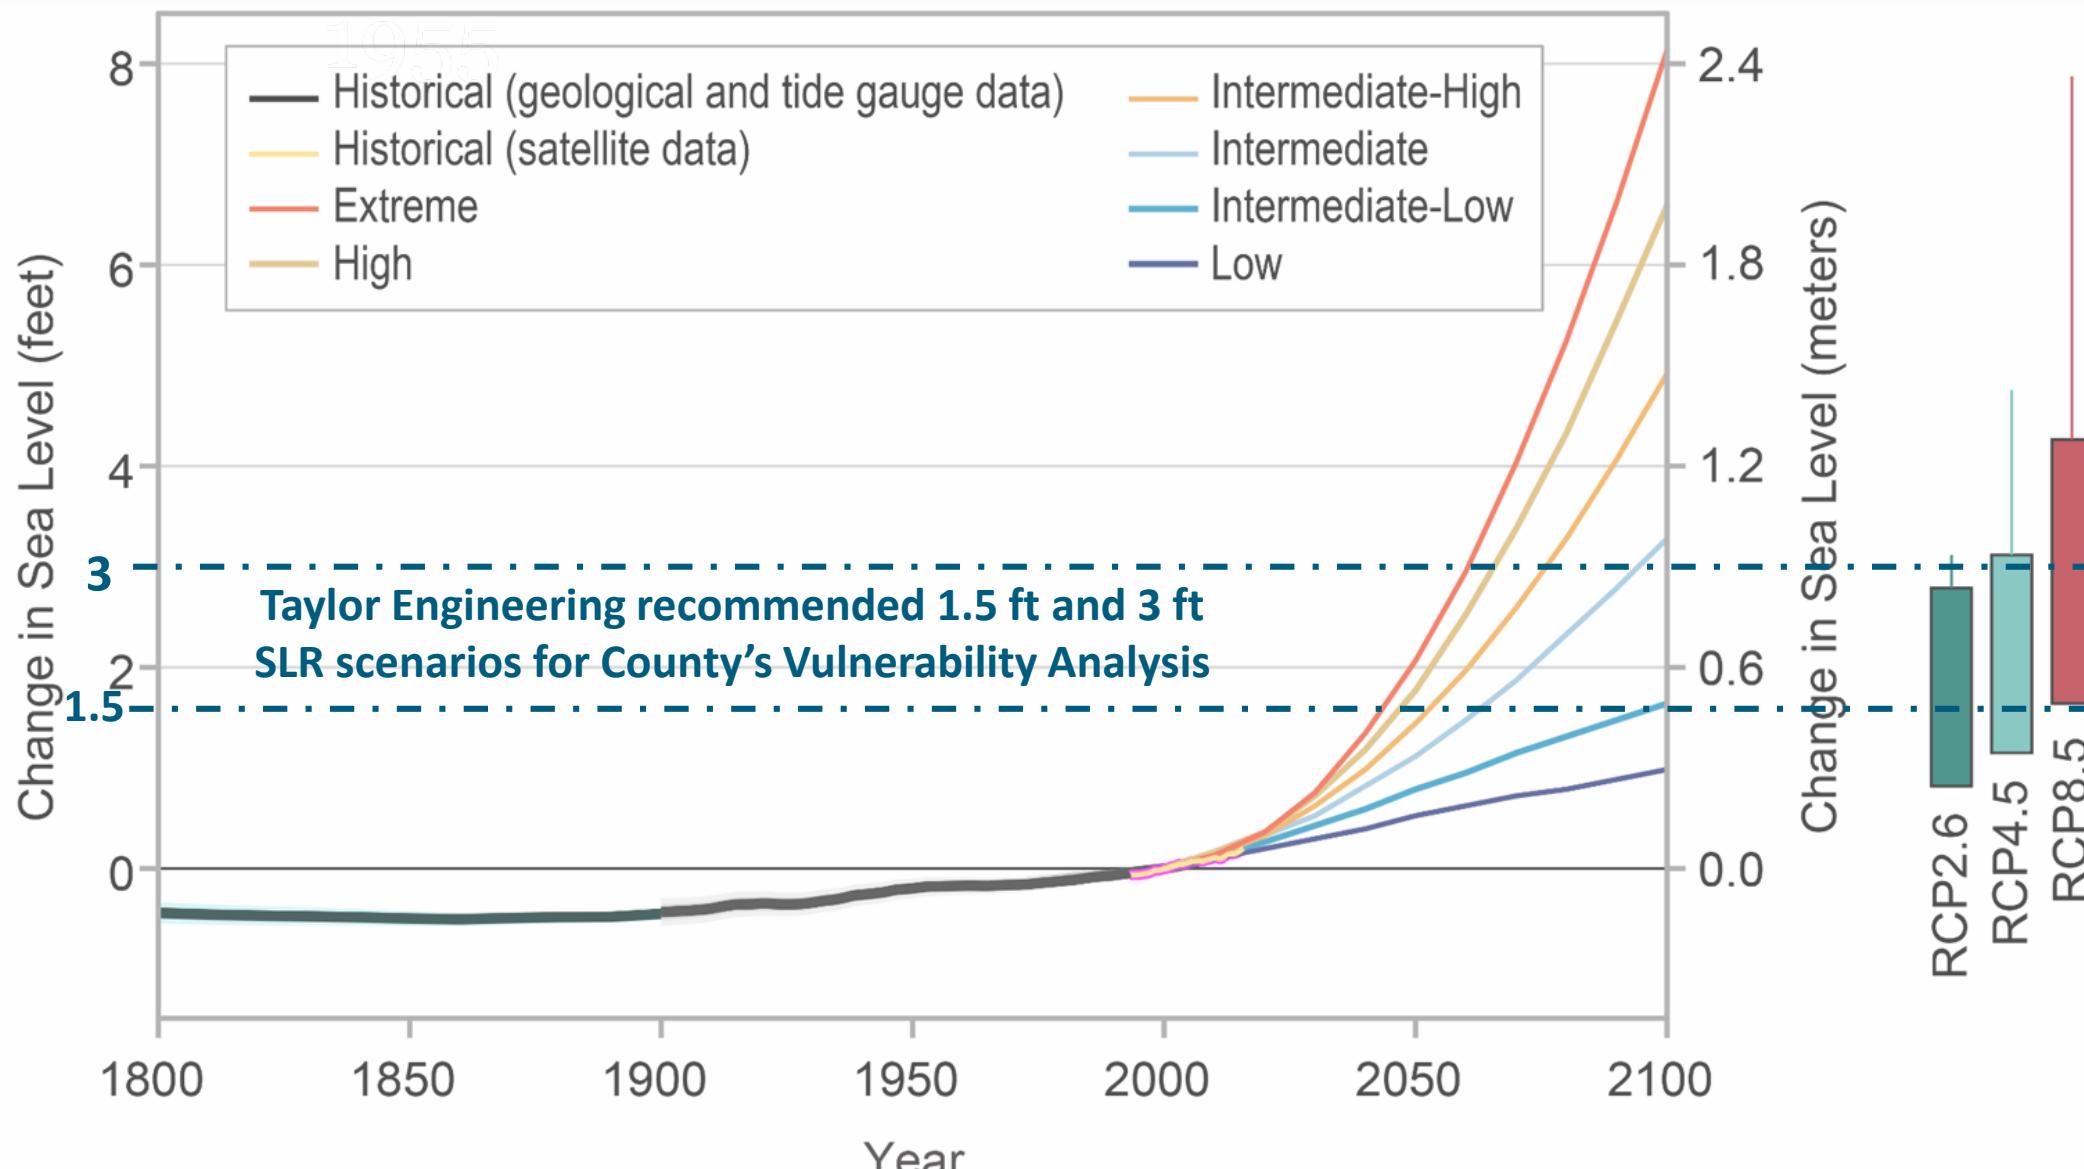

- Sarasota County Post Disaster Redevelopment Plan (2015)
  - Mapped 1 to 4 ft of sea level rise and a Category 1 storm surge
- City of Sarasota Climate Adaptation Plan (2017)
  - Studied 1 ft, 2 ft, 4 ft, and 6 ft of sea level rise above current MSL
  - Estimated 1 ft to 1.5 ft increase of sea level by 2050 (NOAA Low to NOAA Intermediate)
- Tampa Bay Regional Planning Council's Climate Science Advisory Panel (2019)
  - Estimates 1 ft to 2.5 feet by 2050 and 2 to 8.5 feet by 2100
  - Recommended using NOAA Intermediate and High scenarios as most likely
- Tampa Bay Transportation Pilot - US DOT Federal Highway Administration (2020)
  - Recommended using NOAA Intermediate-Low scenario at 2045
- Sarasota County Sea Level Rise Working Group (2021)
  - Assessed facilities at USACE Low and High sea level rise scenarios at 2030, 2050, 2100
- SW FL Regional Planning Council Climate Planning - Florida Gulf Coast University
  - (ongoing - due in 2021)

# Comparison of USACE and NOAA Sea Level Projections

Source: Fourth National Climate Assessment (2018)

# Global Mean Sea Level Trends and Projections

# Probabilities of Occurrence of NOAA SLR Scenarios

---

Sea Level Rise Scenario	RCP2.6	RCP4.5	RCP8.5
Low (0.3m)	94%	98%	100%
Intermediate-Low (0.5m)	49%	73%	96%
Intermediate (1m)	2%	3%	17%
Intermediate-High (1.5m)	0.4%	0.5%	1.3%
High (2m)	0.1%	0.1%	0.3%
Extreme (2.5m)	0.05%	0.05%	0.1%

# Flood Inundation Scenarios for Infrastructure Analysis

---

- GIS-based analysis
- Assessed 6 different scenarios
- Compared elevations of County's chosen coastal infrastructure to each flood scenario

Flood Inundation Scenarios		
1	2020 water level (MHHW)	No storm surge
2	1.5 ft sea level rise	No storm surge
3	3 ft sea level rise	No storm surge
4	2020 water level (MHHW) + 2% annual chance flood (50 yr)	
5	1.5 ft sea level rise + 2% annual chance flood (50 yr)	
6	3 ft sea level rise + 2% annual chance flood (50 yr)	

# Flood Inundation Scenario Analysis Example

# Vulnerability Assessment Results – Surface Area Inundation

Sarasota County Gulf-Fronting Coastal Areas in Resilience Study	Percentage of Barrier Island Inundated at each of the Coastal Flood Scenarios				
	1.5 ft SLR	3.0 ft SLR	2% Annual Chance Flood	1.5 ft SLR + 2% Annual Chance	3.0 ft SLR + 2% Annual Chance
Town Of Longboat Key	3%	8%	72%	88%	96%
City of Sarasota (Lido Key)	11%	26%	66%	88%	97%
Siesta Key	6%	24%	86%	95%	98%
Casey Key	6%	14%	32%	51%	67%
City of Venice (Island)	0%	3%	10%	15%	23%
Manasota Key	11%	21%	60%	76%	87%

# Vulnerability Assessment Results – Evacuation Routes

	HEALTH (Assisted Living Facilities, Hospital)	0					
	PUBLIC FACILITIES	0					

An aerial photograph of a coastal landscape. On the left, there is a mix of green land with some paths and developed areas with buildings. A long, sandy beach runs along the center, leading towards a city skyline in the distance. The ocean is visible on the right, with white waves crashing onto the shore.
