Historical shoreline change along a Florida Barrier Island

<https://coastalresilience.org/project/coastline-change-historical-data/>

Morphologic and Shoreline Change Monitoring

Useful for:

- Pre-storm vulnerability assessment
- Post-storm recovery documentation
- Seasonal variability of beach volume
- Decadal trend documentation
- Nourishment performance monitoring

Advances and Limitations:

- RTK-GNSS Surveying – time consuming and irregular
- LiDAR – costly and prone to aliasing
- “Argus” Imaging – cumbersome instrumentation

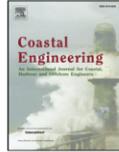

Need something that can provide inexpensive, frequent data points/observations.

CoastSnap

Introduced in 2017 in Australia

Utilizes passers-by and their smart phones placed in fixed cradles

Images uploaded to a database and quantified with photogrammetry

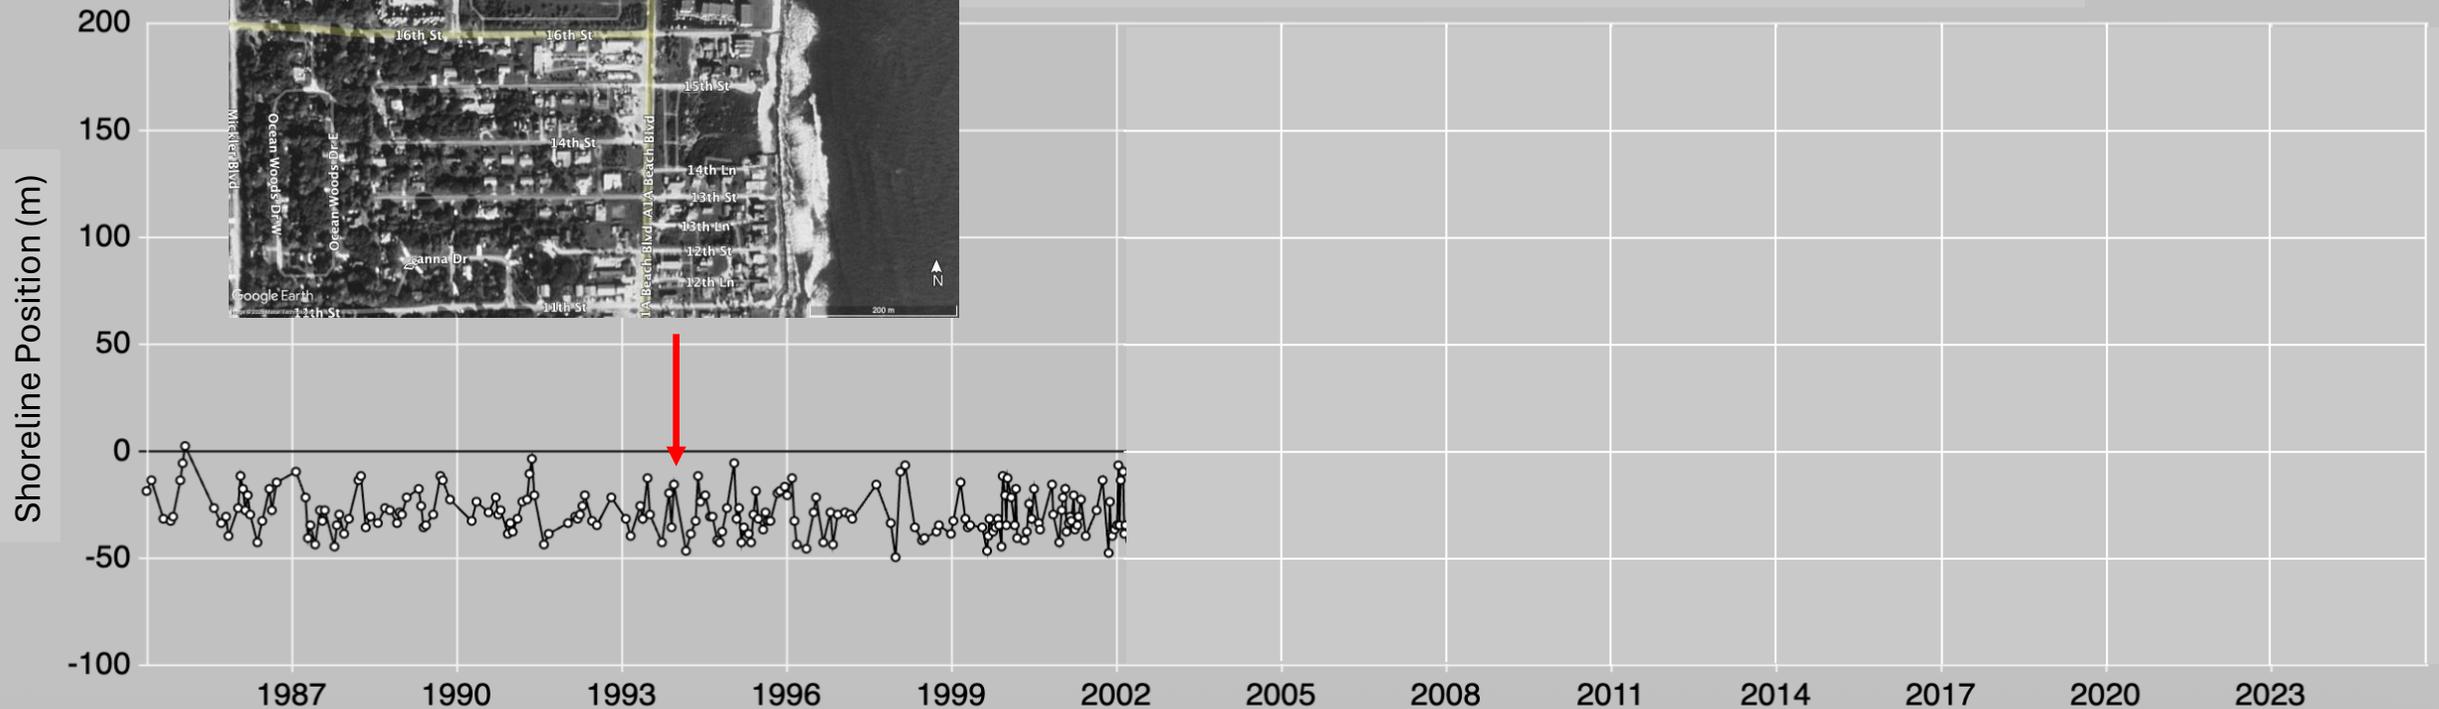

By 2022, over 200 sites in 21 countries

Project Timeline

Feb. 11, 2025: Initial planning discussion with St. Johns County Parks & Rec

May 7, 2025: Initial site visit and measurements

Jun. 6, 2025: Proposal submitted to SJC Parks & Rec

Jun. 12, 2025: Field test with plexiglass mock-ups

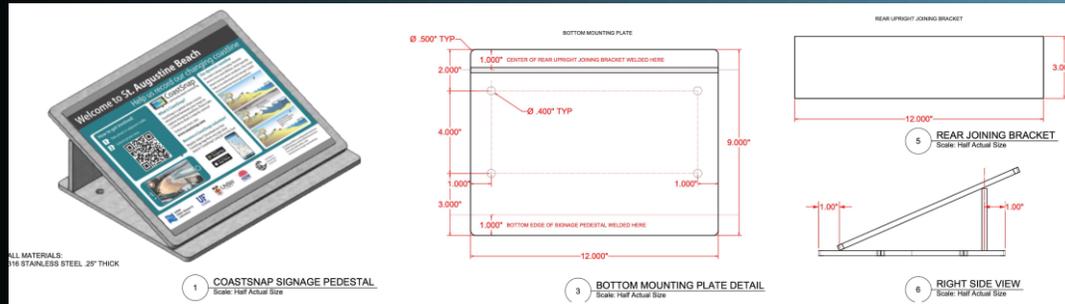

Jun. 16, 2025: Meet with Santa Fe College welding team

Jul. 15, 2026: Welding of Cradles and Sign Pedestal completed

Aug. 19, 2025: Installation of cradles and GCP survey

Oct. 16, 2025: Signage installation

Dec. 12, 2025: Presentation of initial data at UF-CCS Summit

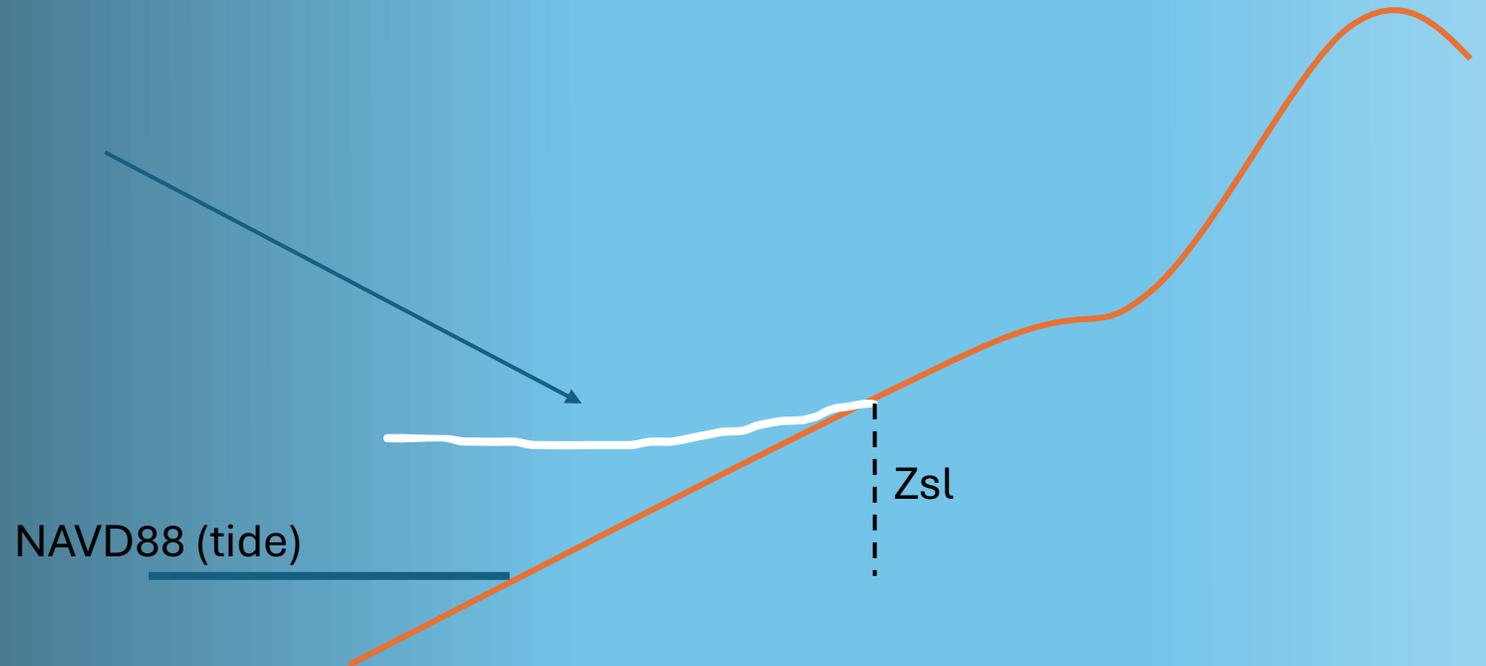

Tidal Correction Elevation of Shoreline

$$n = 0.35 * \beta * \sqrt{\frac{H_0 * T^2 * g}{2\pi}}$$

$$Z_{sl} = Z_{tide} + n \text{ (wave setup)}$$

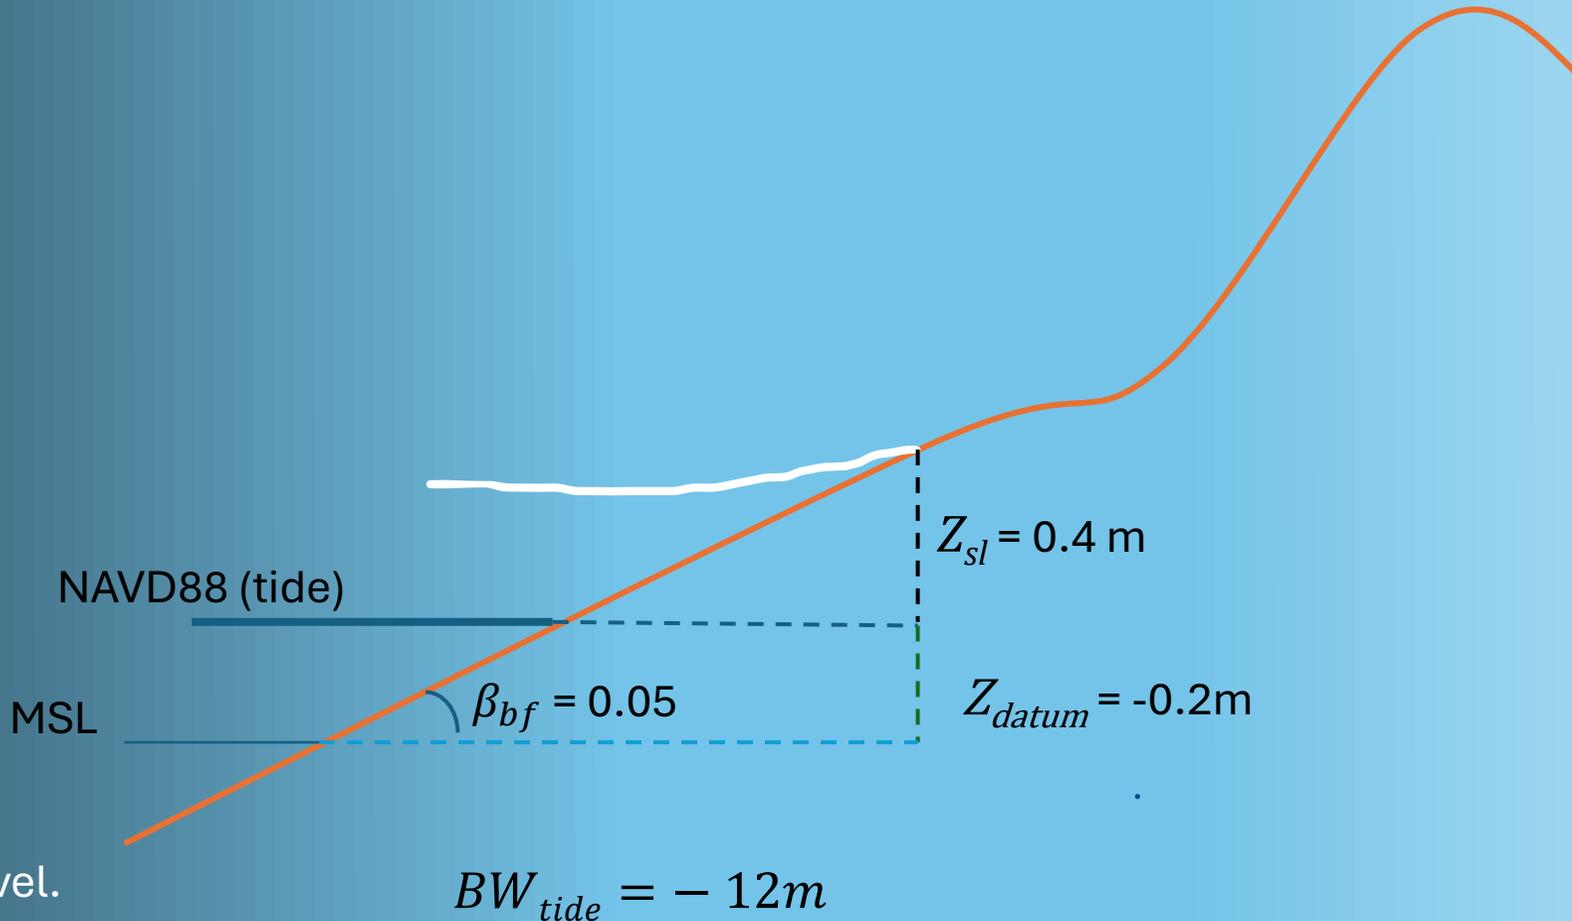

- Z_{sl} - the elevation of the mapped shoreline
- Z_{tide} – Astronomic tide
- ΔZ_{const} – is the tidal offset (e.g., 0.2), From Stockdon et al. (2006) Equation 10
- Z_{sl} - is assumed constant alongshore

Tidal Correction Beach Width (BW)

$$BW_{tide} = \frac{Z_{datum} - Z_{sl}}{\beta_{bf}}$$

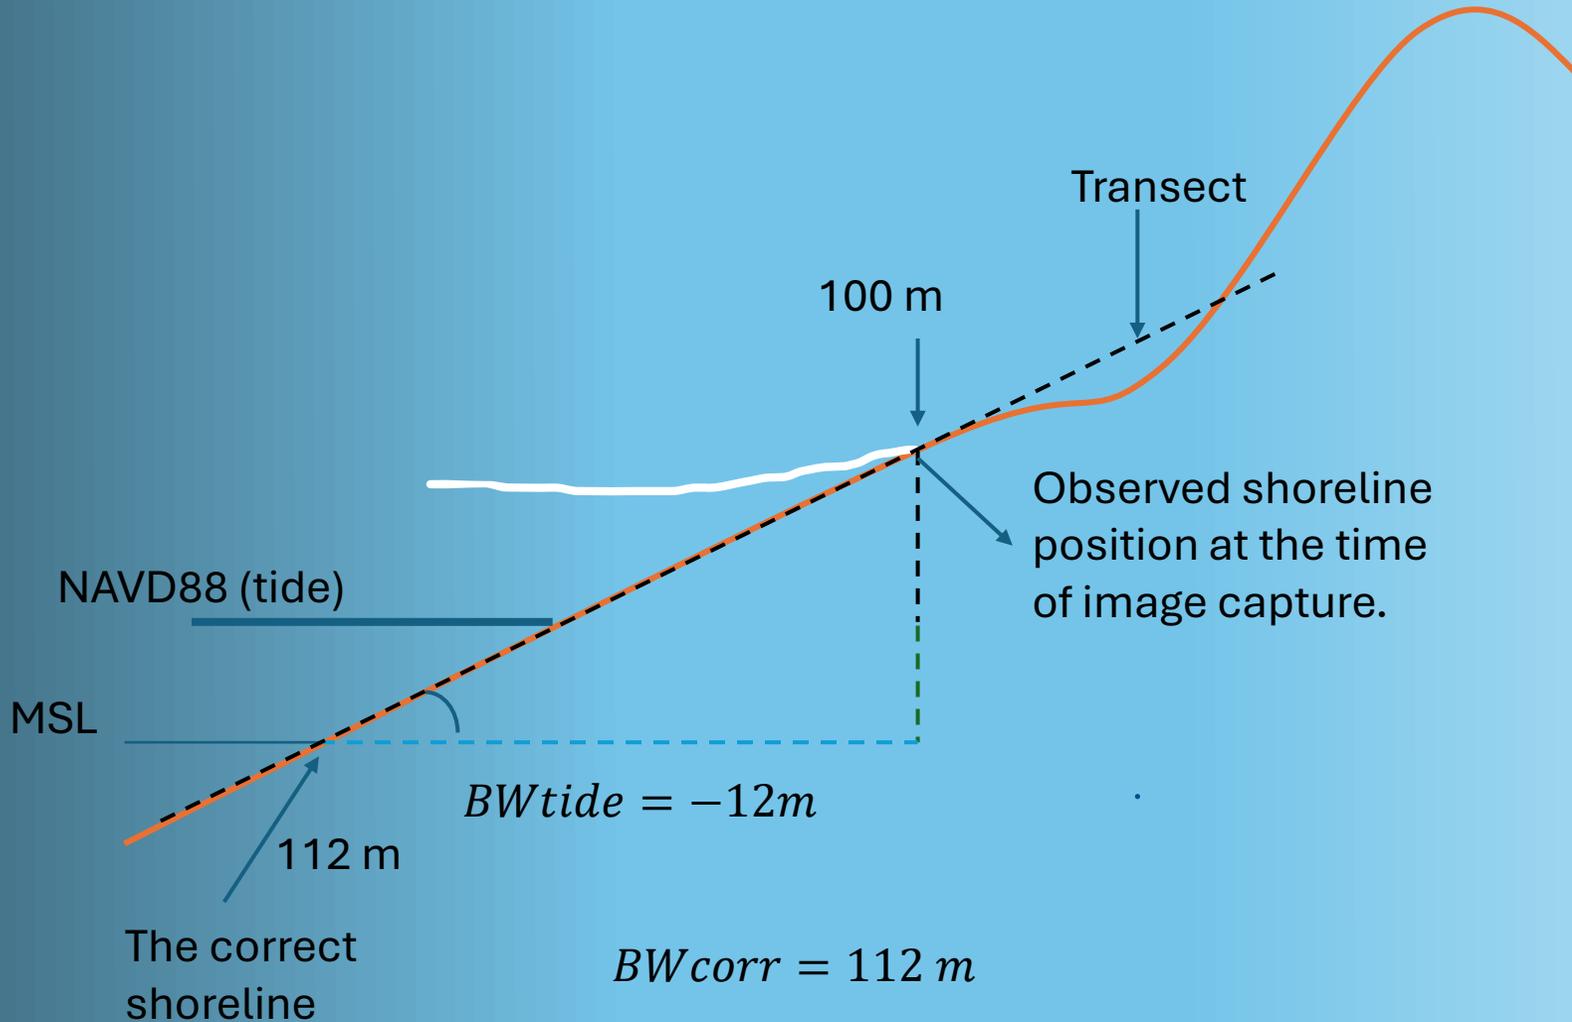

- Z_{sl} - the elevation of the mapped shoreline
- Z_{datum} - is the MSL referenced to NAVD88
- β_{bf} - is the beach face slope
- Z_{sl} - is assumed constant alongshore
- BW_{tide} - horizontal displacement of the shoreline relative to the reference water level.

Tidal Correction Beach Width (BW)

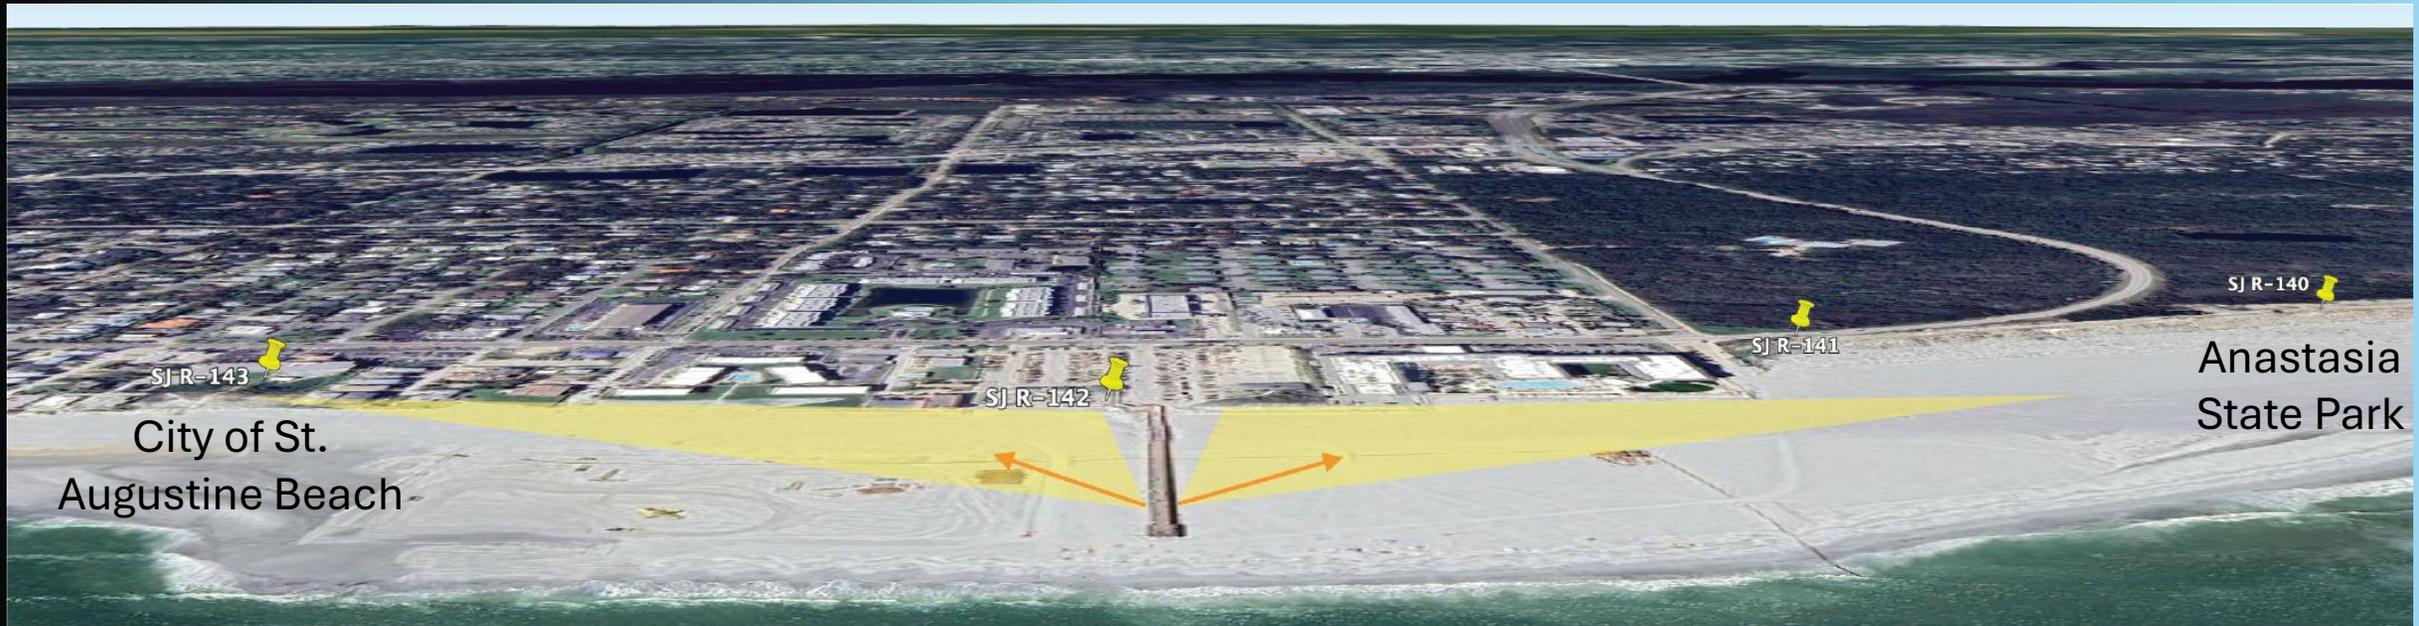

$$BW_{corr} = BW - BW_{tide}$$

- BW is the beach width at the time of image capture, measured where the detected shoreline intersects the transect.
- BW_{corr} is the beach width corrected to the reference datum.

St. Aug. Beach Pilot Study

- 2 cradles installed – one north-facing, one south-facing
- 3+ months of observations (mid Aug. to late Nov.)
- 168 Total images collected (95 & 73, respectively) – more since
- 8 image dates selected for pilot analysis (late Aug. to late Nov.)

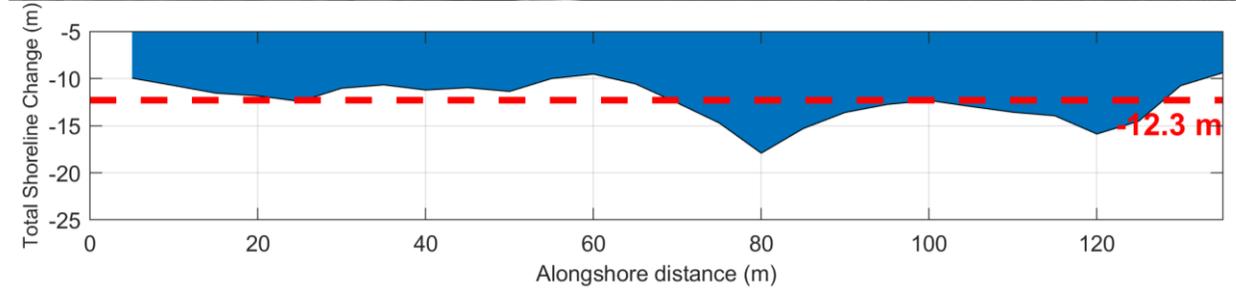

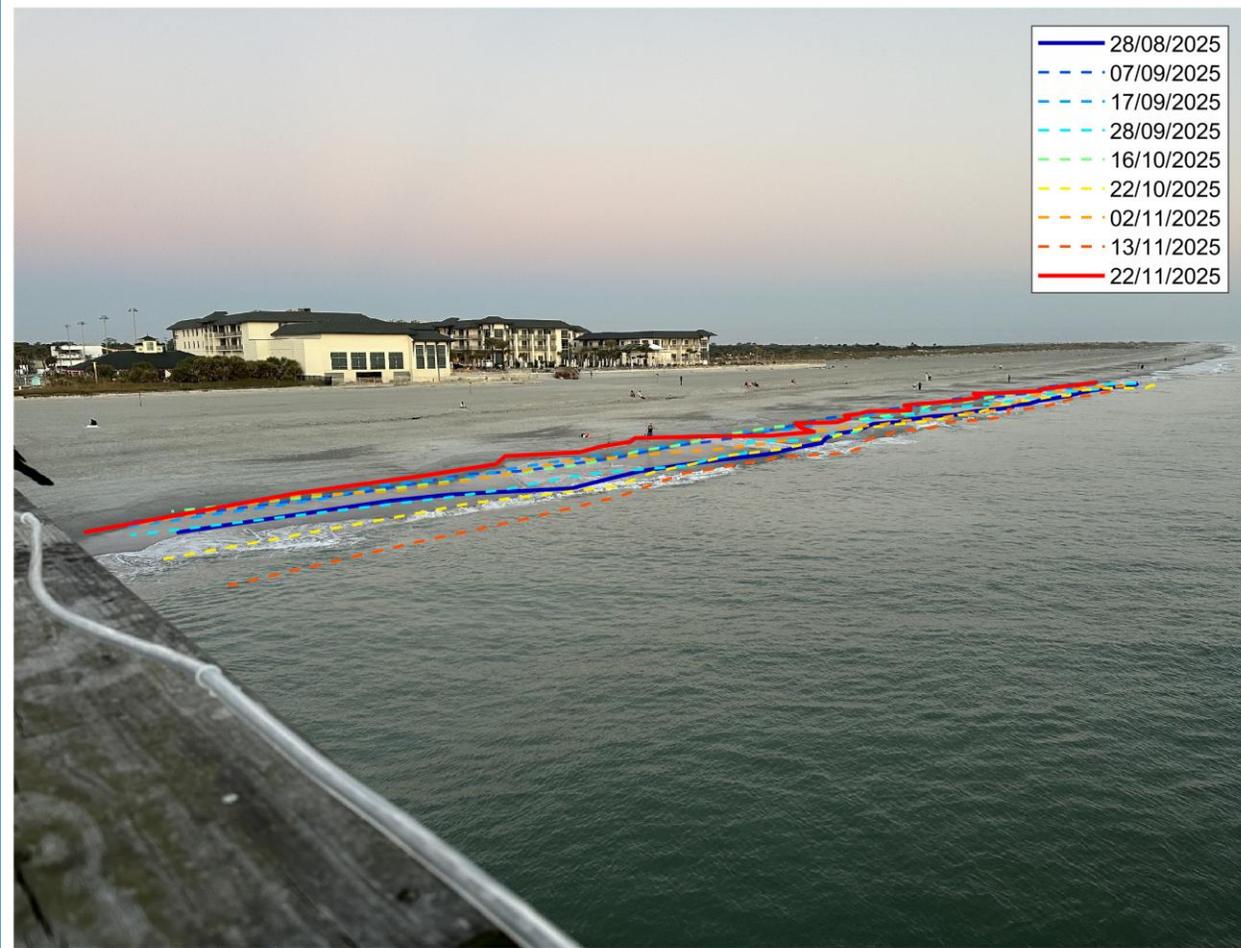

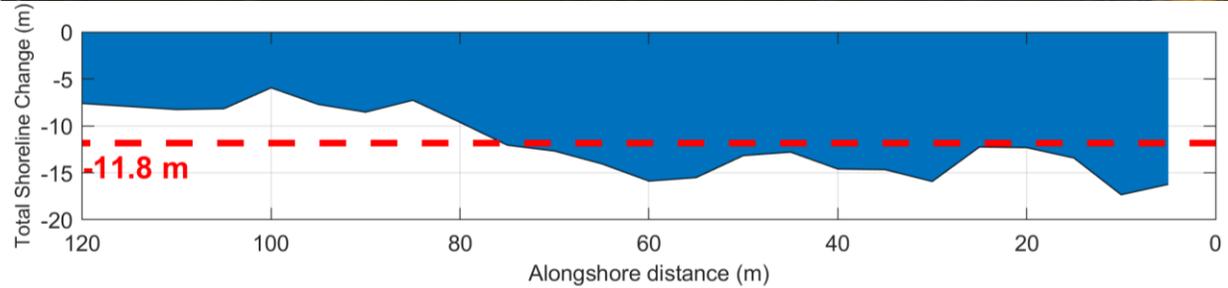

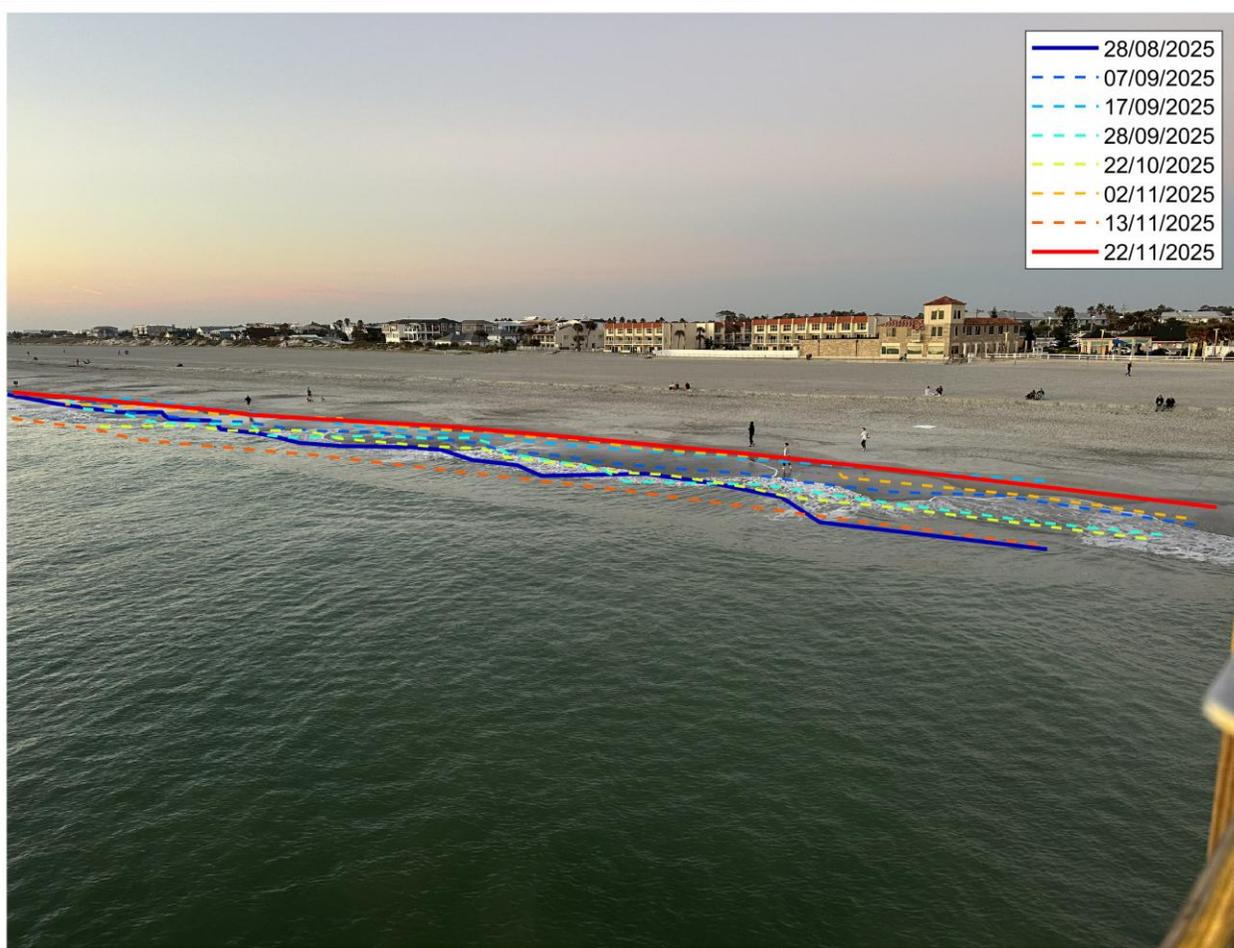

Animations of Stills: Late August to Early October, 2025

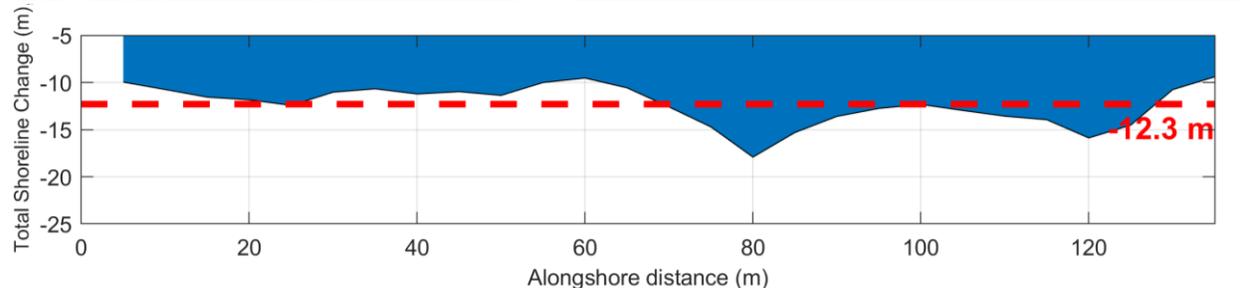

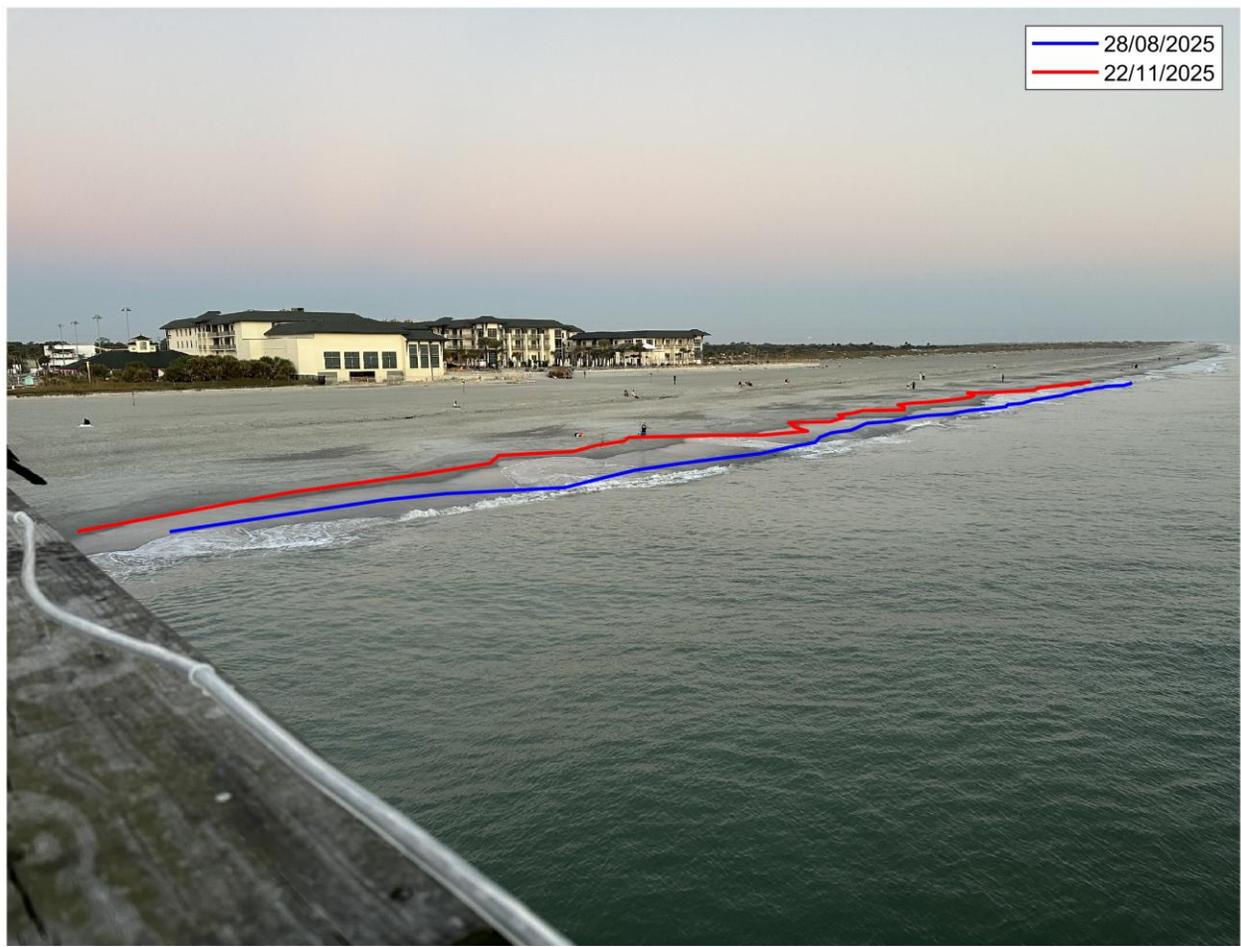

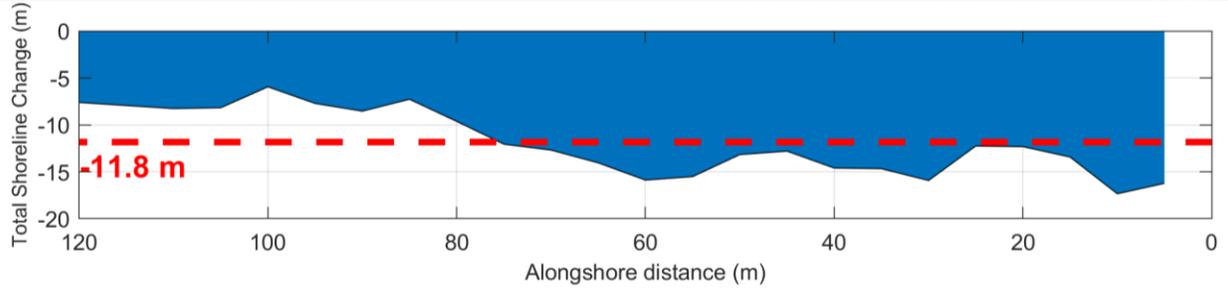

- Produced by Ben Wilkinson's lab group (undergraduate student Aidan Hurwitz)
- Rectified - all photos shifted to common field of view
- Useful for visual identification of morphologic change

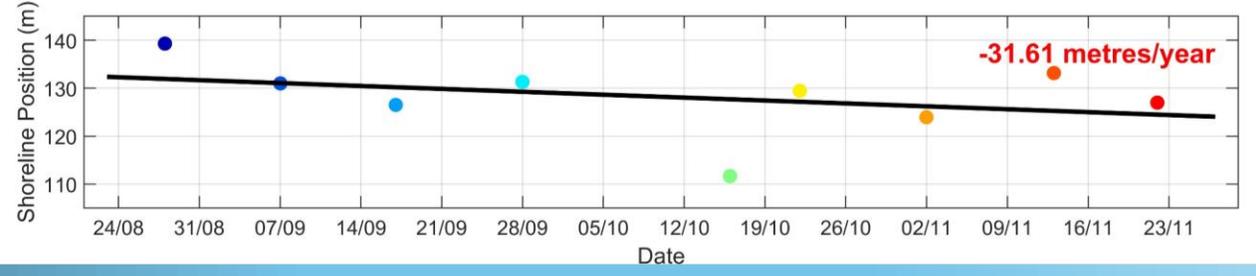

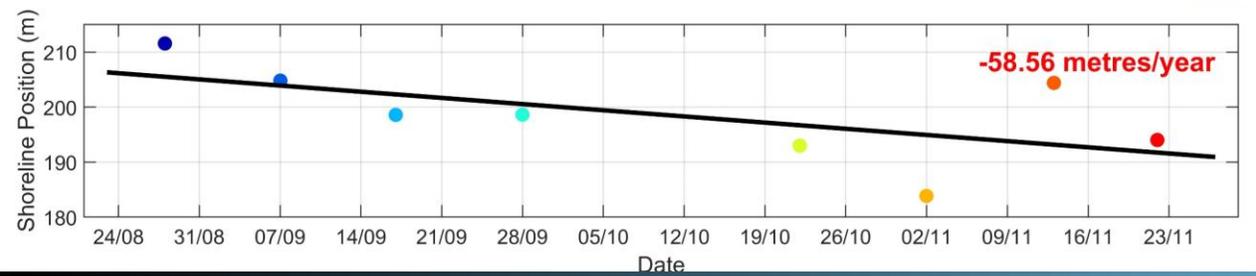

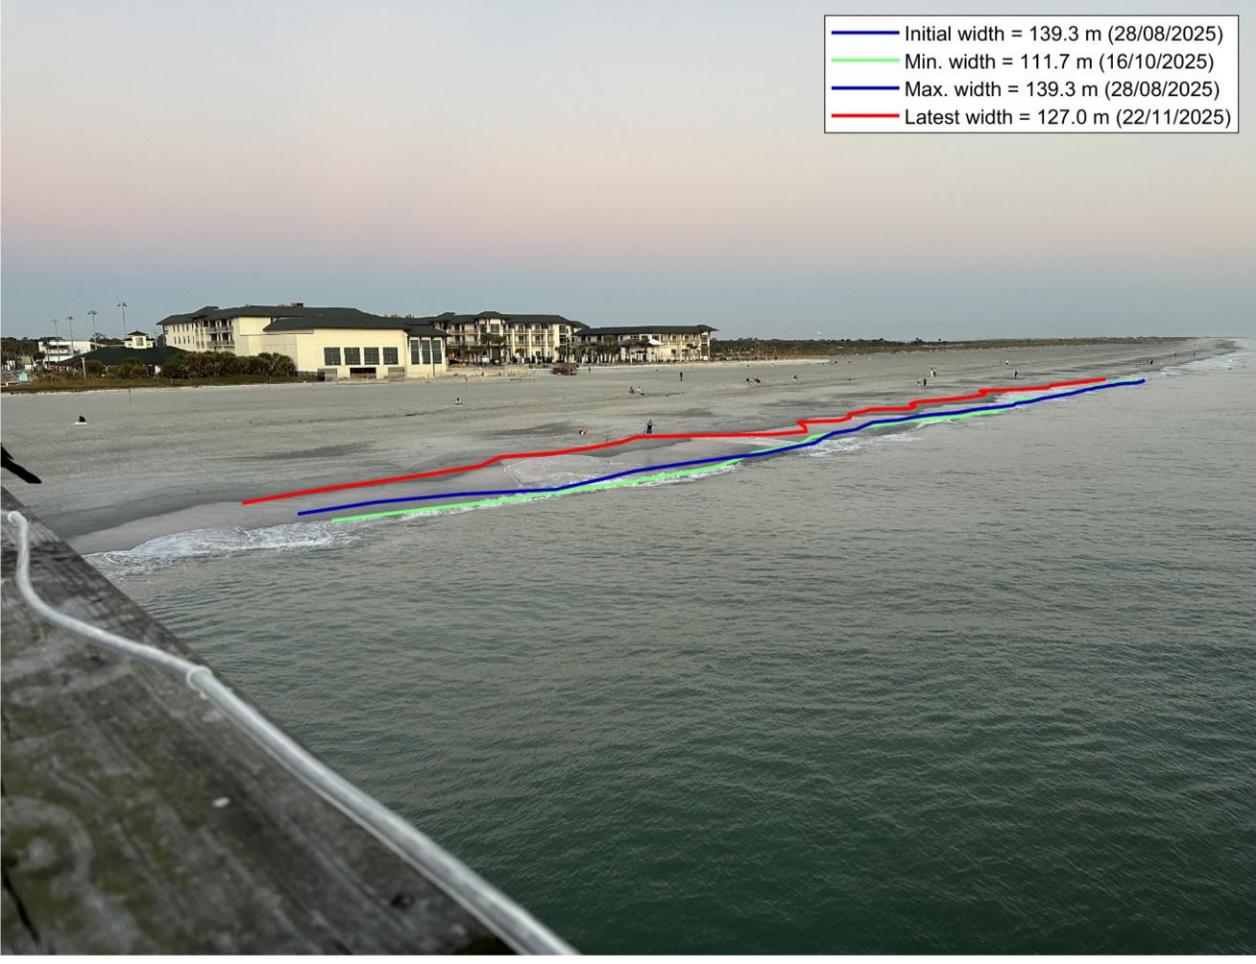

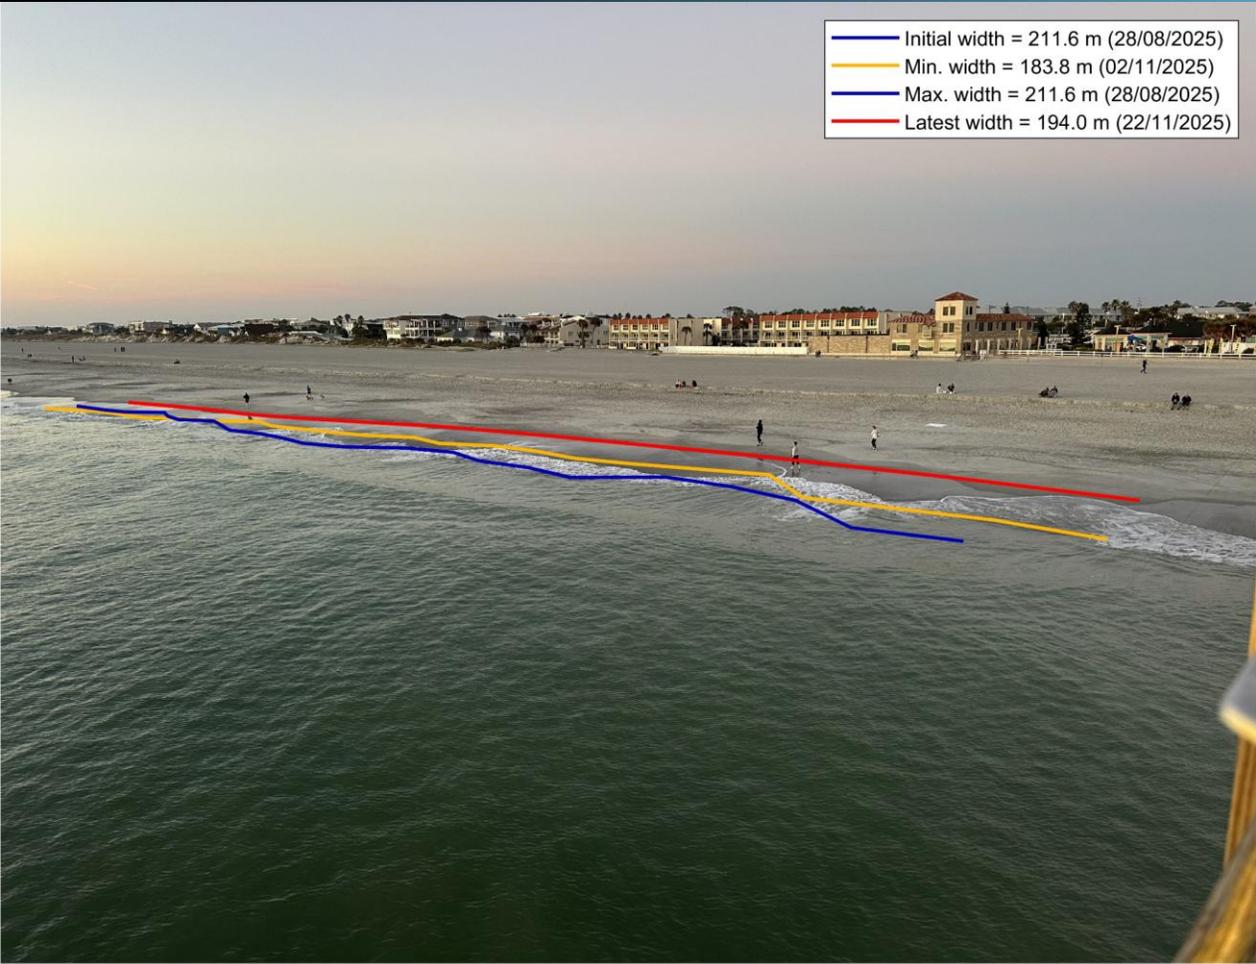

First Quantitative Analysis

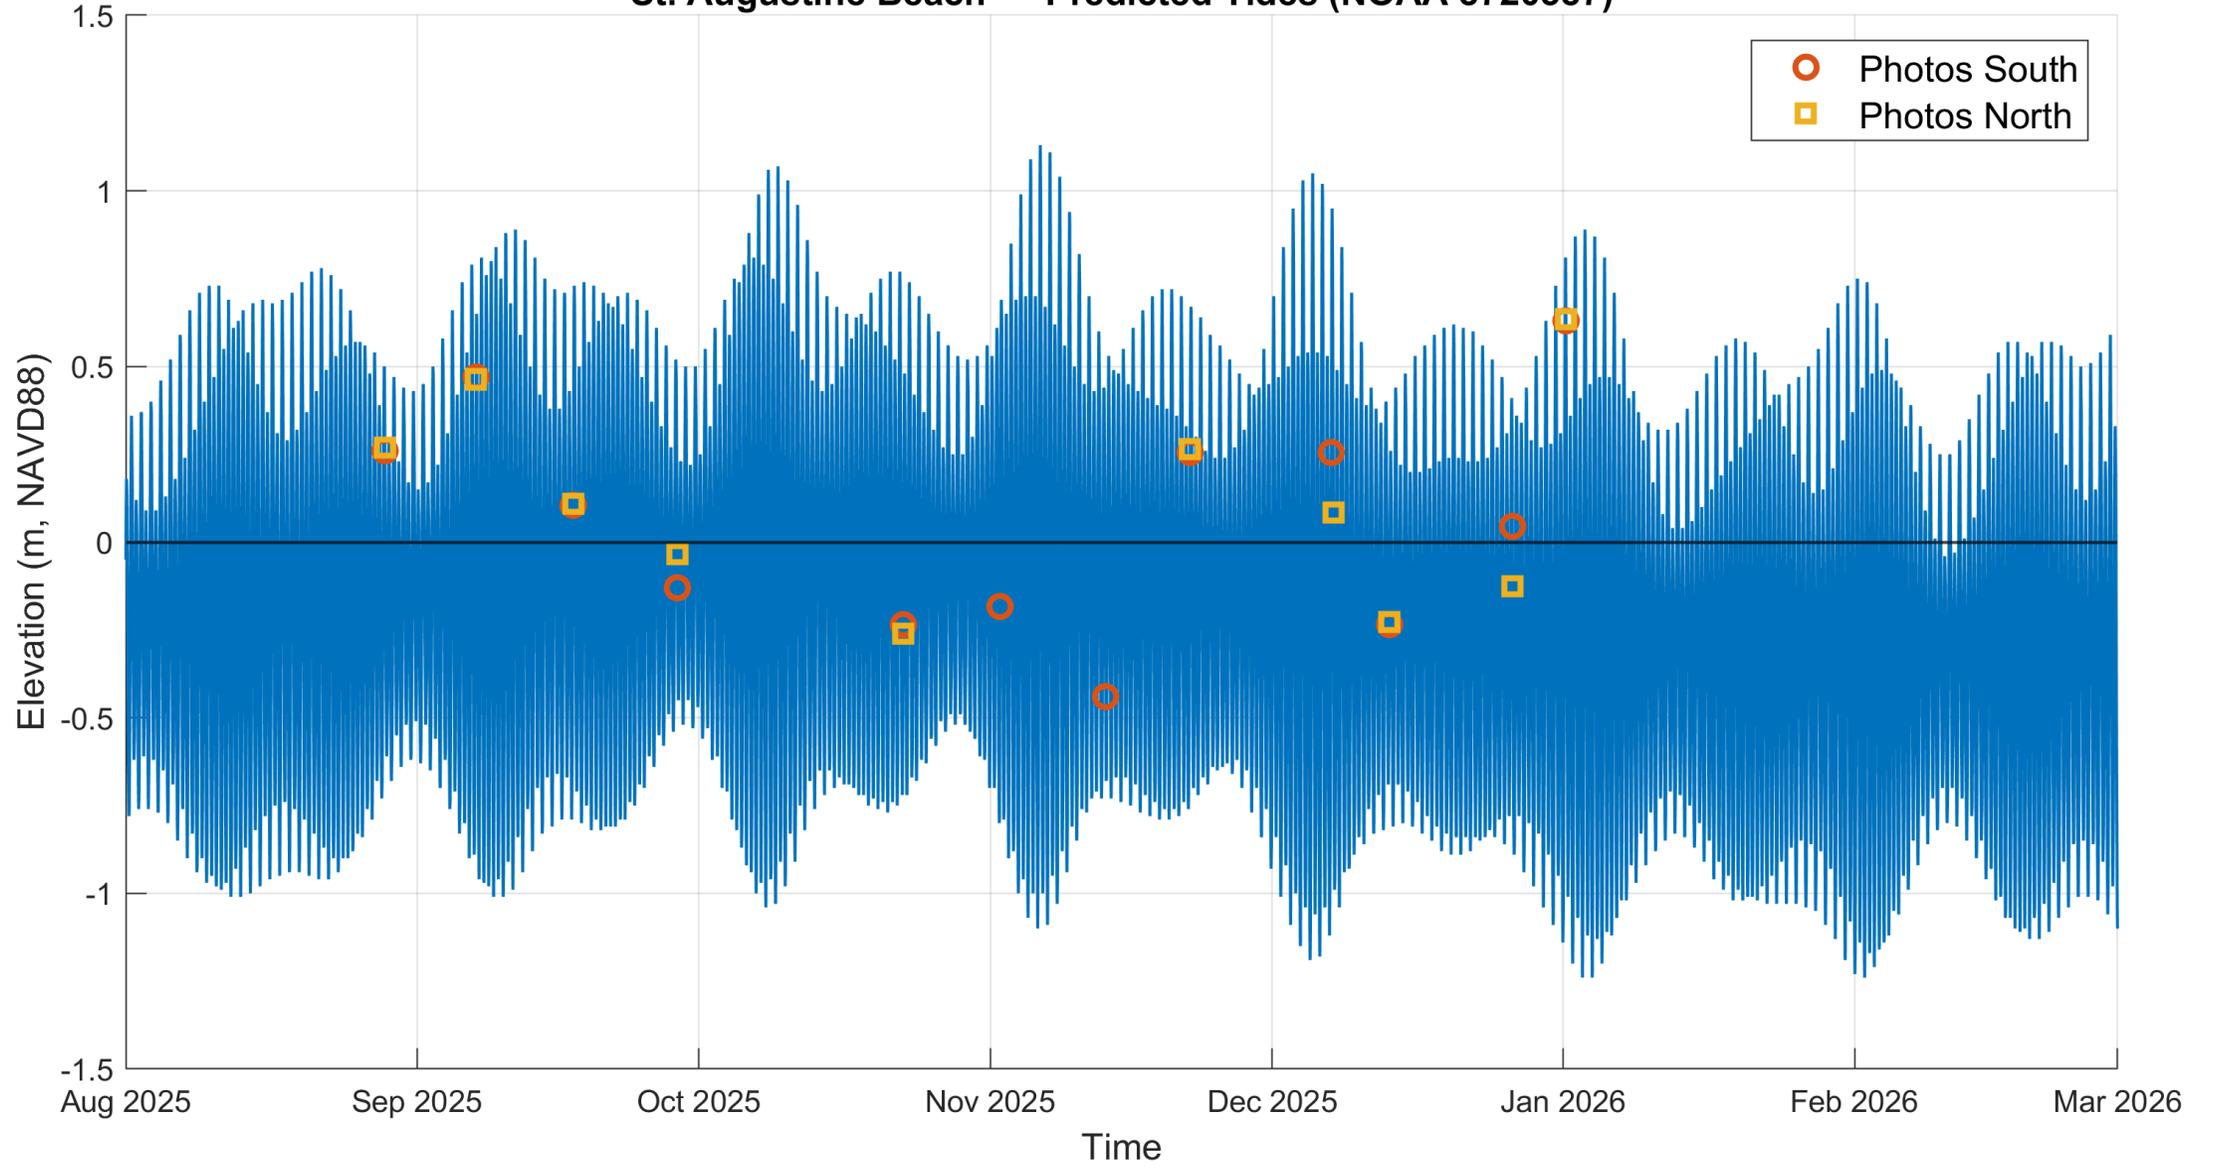

First Quantitative Analysis

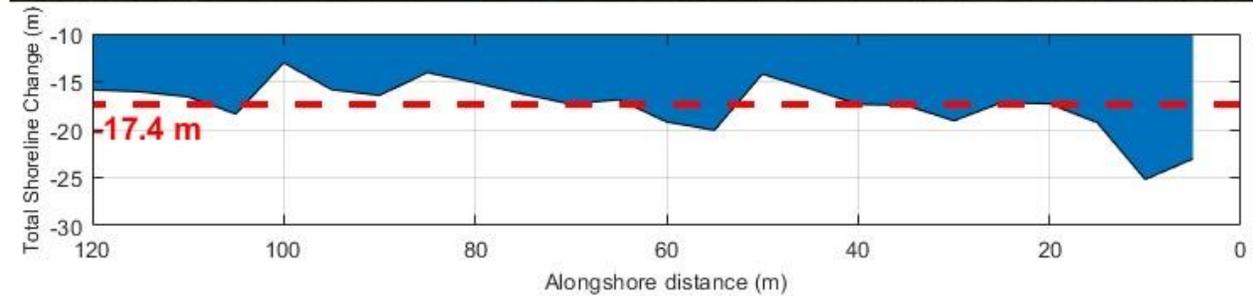

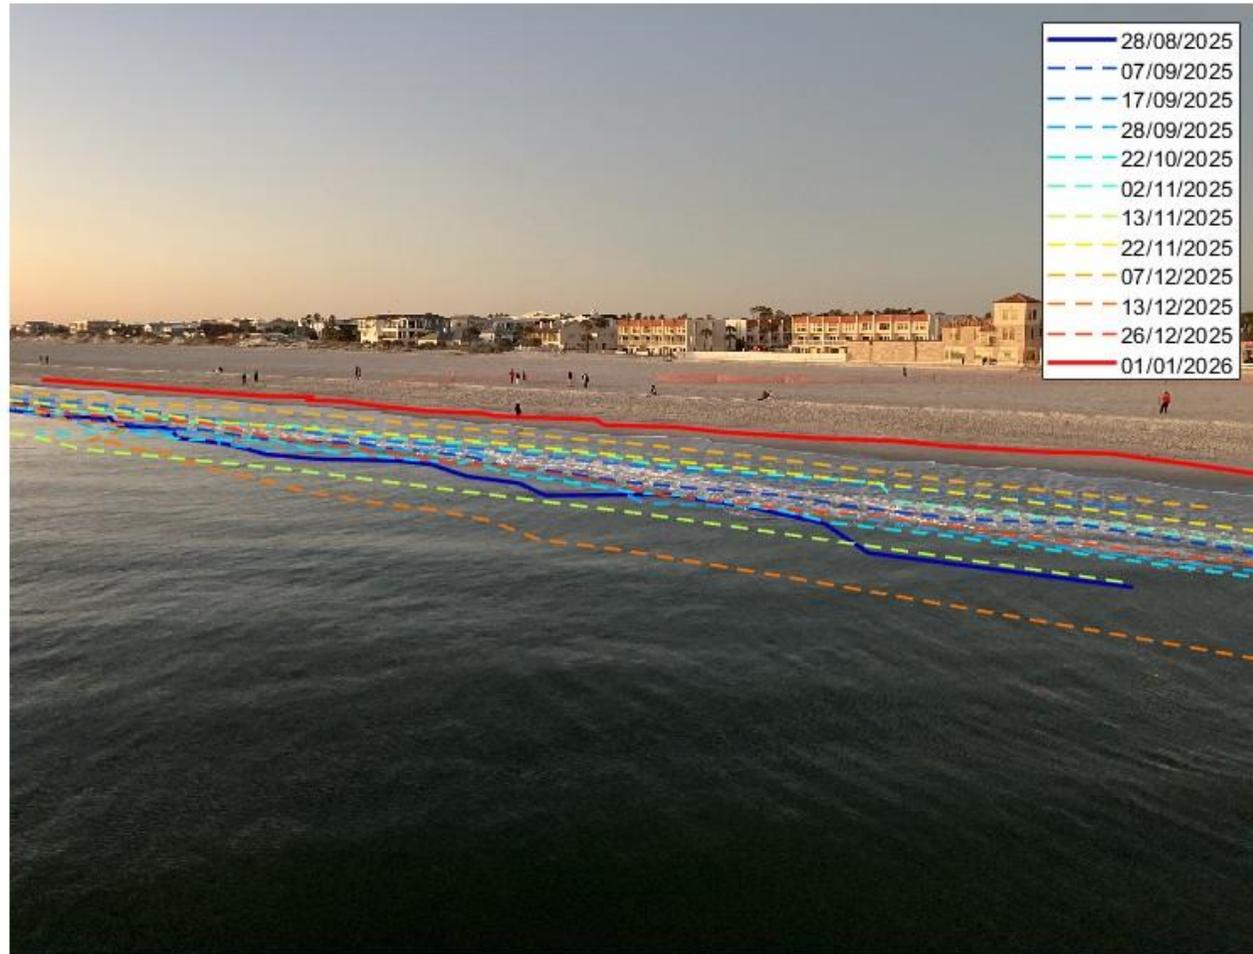

Shoreline Retreat Rate

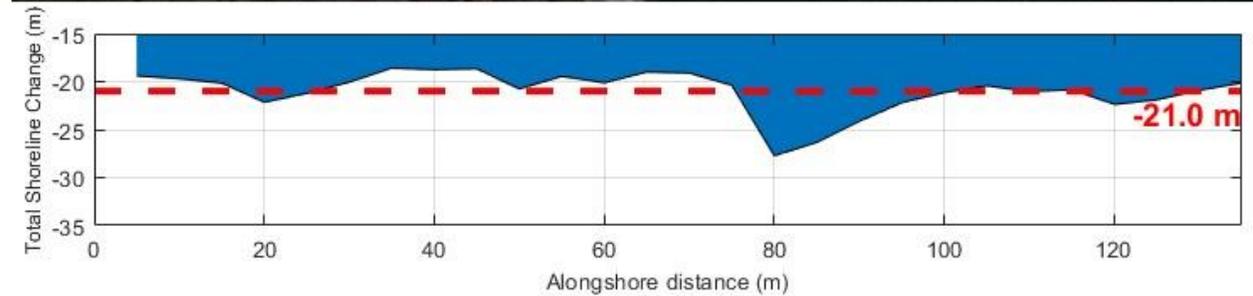

St. Augustine Beach — Predicted Tides (NOAA 8720587)

— 01/01/2026

Shortcomings

Based on foot traffic – St. Johns County charges to fish/sightsee off the pier – deters some potential visitors

Fishermen – like to occupy cradle positions – limiting access

Potential Vandalism?
